all radios use line of site to transmit a signal
all antenna use line of site to get a good signal & they need a good power source to transmit mit and receive this is the best antenna a lot better than a stock you might get 100 ft. to 1 mile the antenna below you get 3 to 5 miles both tx & rx
C.CRANE has a 30in. handheld antenna that is great to use the best i have come a crossed for a hand held here is the info. on it
SUPER CB RUBBER DUCK
Cherokee has a great new Rubber CB antenna to give 25% greater transmit distance to any portable CB radio. If both of your CB units use them you increase distance by 50%! Size: 30" long. BNC connector. Item #SA4
............$29.95

<<you dont know what your talking about dwight. he wasnt talking about made up callsigns but rather those you hear on 11 meters from dx groups and there are several data bases like that already.>>

Doesn't make any sense, though. What's to stop Fred, "19IR01"
from New Jersey (he just picked the number out of a hat)
getting confused with Tim "19IR01" from Germany?

And since everyone's "anonymous", there could be a dozens of duplicates of "callsigns".   No one can actually know, with any certaintly, exactly who they are talking to, and where they are located, because (I am told) most "cb dxers" prefer things that way.

Small FLAME ON

I don't know about everyone else, but I am getting tired of this.

MAYBE means perhaps

WERE means
were (w�r)
v.

Second person singular and plural and first and third person plural past indicative of be.
Past subjunctive of wish.

Perhaps you meant

we're (w�r)

We are.

Although this is listed in some dictionaries, I believe it is a 'modern' addition to the language.

The correct spelling is:

They may be watching, but we are listening.

Small FLAME OFF

Not unusual, reason for my Amateur Ticket, but I don't keep donuts in
vehicle (might draw bears).

Why are we limited to your list of two choices? We is quite possible to adhere to the traditions of amateur radio and to experiment with new technologies as they come along. As to radio and data "needs" what might those be? What form would they take?

> Growth = New modes and technologies.
>
> Stagnation = Preserving "the old".
>
> So tell me which is better for ham radio for the long term?

And if I don't care for your two definitions? How about:

Growth = more people becoming hams

Stagnation = No more people becoming hams

or

Growth = more hams upgrading

Stagnation = more hams staying at the entry level

How did it come to pass that you get to list our choices and make up our definitions?

Yes , I know , There is no problem using the equipment I have, I have "accumulated" it over the years. I could go out and get a top of the line network analyzer and all the fancy stuff. However there are enough folks on these news groups alone that know I only charge 25-35 dollars for almost any repair (except extremes) and have 3 day turnaround and what would they say when I have to charge them 5 times as much to get the same job done using "over-kill" equipment and if I played "Super Tech" as most do? I NEVER claimed to be the best nor do I actually claim anything. I fix a radio and do it right, thats why I get so many of you people that return. You people that I do work for know me. Why set up SSB frequency with a 7 thousand dollar analyzer when I can do the exact same with a 2040? , Thats for the "Super Tech's" not me.....Actually I work for a defence contracter and have for the past 17 years. I don't even think about making a living off of CB. I do it because I love it. There is nothing wrong with that. Beware of people who "claim" to be so called "Super-Tech's". They are nothing more than a person trying to be a dream...

Again Arnie you are making an assumption that any No Code Test Advocate who uses the Term CW in their post is automatically attacking the Mode. I am one of the strongest advocates of eliminating the CODE TEST, NOTICE I SAID CODE TEST, that you will find in the ARS yet I AND MANY OTHERS COULD CARE LESS WHETHER YOU OR ANY OTHER AMATEUR IN THE ARS USES MORSE CODE ON THE BANDS. Sorry about shouting but it seems the only way to get the point across to you.

Most of us don't have a problem with its use on the bands, what we disagree with is using it as a filter to limit access to the H.F bands or as a heavily weighted PASS/FAIL TEST ELEMENT.

Based on what you just said, we should put *all* analog voice modes to pasture. SSB is at least fifty years old and hasn't changed much since then. Are you saying that we should not use it on HF anymore? I personally have nothing against SSB, as long a people don't feel that I *have* to do it just because they do.

Secondly, you must nevar have heard of the National Traffic System, huh? NTS CW nets send thousands of pieces of traffic a year and the NTS is an integral part of local and National emergency communications. Right, CW is a novelty. Listen on 3593 at 7 and 10 pm EST (GSN) or 3567 at 7:45 and 9:pm EST (4RN) and see just how *serious* CW traffic handling can be. You are seriously mis-informed, my friend.

You have blurred the line between testing and use, haven't you? If you are saying that we should not use CW in the ARS because is antiquated, then you and I and a whole *lot* of other peole who use CW on a regular basis are going to have a huge fight.

>For something to survive, it needs to adapt, evolve, and keep ever aware
>of coming changes in its environment. If something refuses to move
>ahead, then it becomes stagnant, and will soon wither.

If CW is so dead, then why are many multiple manufacturers still making thousands upon thousands of keys , bugs, and paddles per year. Are they bad businessmen, or do they know that there is still a huge demand for the product?

>Ham radio is stagnant. For the most part, the people there are appliance

What's better for Ham radio in the long term is to preserve the traditions and continue to use CW. The testing issue is just that, another issue. Don't confuse or blur the two, as you obviously have done. Mr. Jones *was* right.

Mr. Townsend,

No need to yell :-) I know that *all* NCTAs don't support the abolishment
of CW as a mode. But a fairly good number of them on this NG *still* are
confusing testing with use. For example:

> Dave Hall wrote in part ...
>
"And if testing is abolished, your fear is that interest in CW will fall
off, and then the FCC will remove the "protected" CW segments.
Preserving CW is something that is important TO YOU, but not necessarily
in the best interest of ham radio as a whole"

>

I replied ...

> Please explain why preserving the *use* of CW is *not* in the best
interest
> of Ham radio?

He answered ...

"Because it is antique. It has outlived its usefulness. It's primary appeal, today is as a novelty mode, for people who ENJOY it, but do not necessarily NEED it."

Notice that I not only wrote "use" but put it in astericks so testing wouldn't be confused with use. Do you really think Dave is advocating a ban on the use of CW, or has he just confused testing with CW use?

The RS HTX-10 uses a "different version" of the processor chip that won't mod. Look at the superstar 4900 & Magnum 257 (same radio) for a mod-able version of the HTX-10. Also the Titan II is a 12W version (mod-able) of the same radio. The mod-able versions sell for a little more .....

I noticed the clarifier +/- 2kc is listed under receiver specs. Does
this mean you can't slide the TX frequency right out of the box?

Only has five digits on the freq. display. Useless for SSB.

Piss poor selectivity.

This is just a typical CB with a few TOYS/R-US options. The
macho name, "Delta Force- Magnum" was designed to mask
the fact that their are more childish toys than radio here.

I have owned m80's m200, 400, m400, m400se, m800, 16pill, and my 32 pill in a few days. I have played with other boxes such as Texas star, shooting star, palamar, boomer, and a few other pieces of crap and none of them compare to my Dave mades.
Im sure there will be plenty of people that will say different but I know what amps I like and Dave Made is it!

It does take time to get them and it does get frustrating if you dont hear from them but remember they are very busy guys because there boxes actually sell, not sit on the shelf!!!!

Hello, I have three of these I've accumulated over the years.. you can probably make at least one working one out of all three, they are fairly intact, one missing relay, one has non-original meter, etc... although no tubes

They all took four 8950's each, so they probably packed a whallop when working.

I was going to become the only Ham in NJ with a mobile tube rig on 10 meters, but now I don't have the time to study for a license, so i'm selling off my stuff..

Price for All three is 95.00,   * AS-IS *, I assume no responsibility for what you   do with them.. INCLUDES postage from N.J.

Respond privately if interested.
Regards,
Joe Pratt, Tubecntral@aol.com

I have a "mini BBS" of sorts here on my ISP's Linux box that I have set up using BBBS/LiI (Linux-Intel) to do newsgroup reading and posting. Love the ANSI emulation :)

Greetings!
```

It's better to disable the power supply line [thru a resistor] when using this on the Pro510e - the Pro510XL uses a simple 4 pin and is a dynamic element.

The squeal is due to the feed line right into the power supply feed.

Very little bypass, or not enough to handle a power mike.

While Dancing with the Mouse on Tue, 23 Nov 1999 22:25:32 GMT, the
Modem interrupted with an MNI from "MC 10kW Jesus
<qsl27@hotmail.com>", and the MotherBoard buffered this to Video RAM:

Greetings!

Kinda' expensive when cheaper and better performing models are out there.

Maybe the word "better performing" is abused.

It's more like "more predictable" models are out there.

Go ahead and buy it, we did warn you.

Dave, a computer can be used to transmit and receive CW as well. So
can a memory keyer and a decoder such as the MFJ-462B. Despite that,
those who don't know Morse aren't likely to tie up large hunks of
spectrum using the CW mode.

One who cannot speak could still use a vocoder. It works well enough
for the USCG to use one to transmit their regularly scheduled maritime
weather broadcasts on HF from NMN and NMG, after all.....

I'd go for the X-Force. As good or better than a Dave box, better customer service, warranty, more options available, and you don't usually have to wait to get one.

Phone, packet, ATV, SSTV, RTTY, AMTOR and PSK are in widespread use,
too. That, if nothing else, is a reason we should, by your logic,
start testing for those modes as well.

<nojunkmail_n3cvj@worldlynx.net> wrote:

>If we don't grow as a service, we will wither and die. The old
>"providing emergency communications" arguement is slowly losing clout.

Nevertheless, here in North Tonawanda, NY the city government has
requested that we amateurs staff the city Civil Defense EOC on New
Year's Eve and that we be prepared to assist the city police and fire

department with communications in case any of the Y2K doom-and-gloom stuff turns out to actually have any merit...and this is in a city where the public safety comms are on conventional VHF/UHF systems, not a trunked system in 800 MHz. And the only hospital in the city has requested through the American Red Cross that amateurs be provided to assist with communications there as well.

I find it interesting to note that, despite the trashing of amateur radio's emergency communications capabilities that goes on in some circles, it seems the authorities always know where to turn when the chips are down, or even when the chips MIGHT be going down.

I know for a fact that we aren't the only locality whose government officials have asked amateurs to be prepared for Y2K, and in some cases that applies to CB operators as well, particularly in those areas where an active REACT group still exists. So, while the number of instances in which the situation actually warrants the NEED for amateurs to provide emergency communications, I wouldn't be so quick to conclude that this equates to a widespread perception in the various levels of government that the capabilities of amateurs to contribute their skills in the event of an emergency has been seriously diminished.

For the most part, the powers that be are well aware of the value of organizations such as ARES, RACES, and REACT, and in areas where there has been a dialogue between such amateur organizations and government officials, the foundation has been in place for some time already. That is the case here, where I live. In other areas, where such dialogue has not yet taken place, it is the responsibility of the appropriate people in the amateur community to see that it does take place. It is too late to set up an effective organization and establish a rapport with local authorities AFTER the hurricane or tornado or earthquake has already devastated your area.

Where I live, we've been fortunate to have good ARES coordinators and we have established an excellent rapport with local government. This, bluntly, is how it's supposed to be done. If the "argument" (as you put it) of providing emergency communications as a means of justifying the existence of the hobby holds less clout in your area (and this applies to everyone, not just to Dave Hall whose message I am replying to) then it's time for you to seek our the ARES and RACES officials in your area and find out why that is the case, and do something about it. Lamenting the facts will not change the facts. The ARES and RACES coordinators in your area represent amateur radio to the government officials in your area. If they aren't doing a good enough job at it, then it is up to you and other concerned amateurs in your area to change that situation. ARES is part of the ARRL Field Organization. RACES is a somewhat different animal, but in many areas - including where I live - the personnel are often the same.

Seeing as how, somewhere along the line, this thread got cross posted to rec.radio.cb as well as rrap, I feel I should also point out that the same applies to REACT groups. There is no longer an active REACT group where I live, they folded shortly after FCC stopped issuing licenses for CB stations. However, many areas are still fortunate enough to have active local REACT groups, despite the general indifference of the national REACT organization, and in many such areas the REACT volunteers are part and parcel of their area's disaster communications planning. If you live in an area where the local REACT chapter has not established that kind of rapport with government officials, it'll do no good to remain outside that organization and vilify it - join it and fix it from within. It's always easier working within the system. :-)

That's NOT an HTX-10. Radio Shack did for a while sell an 11-meter radio
that resembles the HTX-10, but I don't remenber the model number.

You are right and wrong at the same time, Dwight. Yes the debate is about code testing, but the NCTAs are blurring the line by attacking CW the "Mode" to make points. For example, when I make a comment about how fun I think CW is, a typical NCTA response would be that I should get out of the "Stone Age" and into the 21st Century because Morse testing should be eliminated. (when I never mentioned anything about testing; only that I enjoyed using CW) This is the point that Mr. Jones was making, and I agree.

```

I want to take this post to apologize to all the techs on this group. I took your advice and took my saturn to my local tech here in wash state. I was amazed at watching him find the main problem whitch was a cracked edge of main board splitting a trace. He fixed it along with some other hack jobs he said were typical of do it your self mod book techs. He showed me around the inside of the radio and tuned it up and took care of bad mod job and week solder joints. All this right on the spot at the same time he had 3 truckers come in with varios other radio problems and he fixed them all as they waited. To top it all off he only charged me
65.00. well worth the work done.

I stand corrected on my past comments. You techs are a needed and greatly appreciated bunch. If not for techs I would be talking on my old radio again.

Also I gave tech an extra 10.00 as a tip for fast work and he woulnt take it.

again sorry all.....
Have a happy thanksgiving.

From the now tech loving happy saturn owner.
Tod Kertz

I'm sure that some no code-testing advocates (NCTA) do lump the two together (CW advocates and CW testing advocates). And they are wrong for doing that, just like you are wrong for grouping all NCTAs together above ("...the NCTAs are blurring...").

However, none of this applies to me. I did not advocate anything in my message (other than an opinion on why some continue to support code testing so strongly). I did not say anything about the elimination of the use of code, nor did I say anything disparaging about CW users.

> This is the point that Mr. Jones was making, and I agree.

I seriously doubt that was the point that Mr. Jones was making because obviously it did not apply to me. It should be clear to anyone that I was only talking about the testing debate, Arnie.

In fact, the very first sentence of my message contained the words, "...the code test requirement..." And I even defined who I was speaking about in that very same sentence - the "pro-code side" (a reference to Dave Hall's comment about those supporting code testing).

I should also point out that I used some variation of the word "test" seven times in that short four paragraph message, so obviously I was talking about testing, not CW or CW users in general.

Therefore, Mr. Jones would have to be really ignorant if he did not understand who and what I was talking about in that message. If we are to assume that he is not that ignorant, then his suggestion that I did not "understand the players" could only be taken as an attempt to distract from my comments by belittling me.

I really hate these damn code testing debates. I'm sorry that I ever posted that first message. I should have known that I would have to post half a dozen messages defending my comments, no matter how neutral those comments were.

FS.

Cobra 85 23 channel base station in A1 working order
Cobra 139 XLR with upper and Lower channels and varable key a very nice radio.

Realistic TRC-458 base radio AM/SSB upper and lower channels and varable key.
Cobra 86 XLR 40 channel with the extra channel mod done.
I also have the following mics
D104 MB6 hand mic.
D104 desk mic BEAUTIFUL mic!
turner + 3 desk mic great mic also.
turner expander 500 desk mic.
and 3 other hand power mics. one i couldnt find a name but it works good and the other two are a Realistic and a Deseal and the good part about these mics are NONE of them use the high dollar batterys.

If anyone is interisted in the whole lot then i will take $350 shipped or best offer...or if someone is just interisted in just one idem we can do that too.

As far as I can see, all NCTAs have the same opinion, end code testing. How do I separate individual NCTAs like we separate Pro-code from PCTA?

I'm sure they do. But, considering all the connectivity junk they
stick on the hard drive (Netscape, IE, AOL, etc.), it might be a little
hard to find it.

My typical solution to all this bloat is to trash anything that I
don't plan to use regularly. So, if anything like that was installed, I
trashed it without consideration.

However, I guess I could reinstall it from the CD, so I should not
have said that I would have to search the internet for a program like that.

Congrats....

Now make a good friend out of the tech., and he will probably show you a few
more things..

Most good techs on the radio today started out as a frustrated radio owner
and then found someone who wasn't an asshole, and showed them "the ropes"
about what to do, and why, and how.

Congrats on your radio.

Toll Free

Dave,

You have given me an excellent opportunity to make a point. It seems that this moving into the 21st Century is important to the NCTAs, I agree. With multiple computers (my slow computer is a 233mhz) configured as a mini-network (Y2K compliant) , DSP technology at my fingertips, state of the art HF rig, and mobile rigs, and all emergency power capable, I think I have taken the steps to enter the 21st Century. Why make this blanket comment because some of us choose to use CW as our primary mode of ARS communication. I and a lot of other Pro-code advocates are well ahead of the moving into the 21st Century curve.

Regards,

Arnie -

You can thank the feds for that. They made the reins on the BBS SysOps so tight that they couldn't do anything but collect a complete dossier on every user.

Did you know that a "PUBLIC FORUM" bbs System Operator was COMPLETELY liable for anything posted to his system message boards? And, unless he could "blaze a trail" to the original poster (for drug and bomb scare tactics, no doubt) he would be the person prosecuted. This also had a LOT to do with the upstart SPA and them trying to get piracy rates down.

Sound far fetched? We had a couple sites that where shut down because they wouldn't / couldn't answer the "proper" questions because they allowed anon access for years. When the feds wanted the info, they closed up shop.

Some even started
> asking for employer, work number, birthdate, and SSN, during the sign up

process.

That is a little far fetched, although if they offered E-Commerce (some did, where you could purchase things on line in the instance of a computer store's BBS) I can see their point.

>
> Since I felt that much of this information could easily be used for
> the wrong reasons (and the operator had no business knowing any of
> this), I simply stopped signing onto BBS'es.

Somehow I doubt seriously that you where missed if you took the same attitude that you do on the newsgroup(s).

Yes, it can be used for bad, but that is a risk that you take. Yes, it is none of their business, but when one person is responsible for YOUR actions, a proper point of contact really is necessary to protect themselves.

Don't believe that, ask Bill Cheek.... (anyone heard from Mr. Bill about how his legal battle is going????)

Ahh...

So you admittedly broke the law, and now chastise anyone else for doing so..

Nice... Real nice. You just blew any credibility that you had out of the water.

I also suppose that you sold those radios to people who would only use them on 10 meters, right?

you dont know what your talking about dwight. he wasnt talking about made up
callsigns but rather those you hear on 11 meters from dx groups and there are
several data bases like that already.

The answer to that Question is simple Arnie, ask him. Most pro-coders
protect CW as a mode by always pointing out its so called advantages over
all other forms of communications. They constantly harp on its so called
technical advantages, call it a tradition and even attribute almost
Mystical qualities to its use as a mode.

Then when someone who sees their post attacks these so called advantages or
claims on the newsgroup or points out that the Mode has declining support
or that the advantages that the Pro-coders attribute to the mode may not
always hold up to close scrutiny. These operators are attacked and your side
says " see it is not the test that they want eliminated but CW as a mode."

Actually, I'd worry more about the 18-20+ gallons of gasoline more. The
minimal amount of propane, or isobutane needed to replace the R12 in the
average system is going to be fairly quickly diluted if the system is
compromised. BUT, that doesn't mean I recommend it, either.

TRC485 and HTX10 seem to have quite a bit different
innards. (1 transistor vs 2 transistor finals =>
around 12W vs 30W power), etc. HTX10 seems to be
the "latest version" of that platform.

BTW, it would NOT surprise me if two identical cases/
faceplate & display setups had completely different
& unrelated innards. Often these cases are bought
just like any other part on the radio - cost, style,
ergonomics, etc. all play a part.

You didn't answer my question. You turned the point on its head and started talking about pro-coders and their attitude. Answer the question. and, those "so-called" advantages do exist. Even the most staunch of the NCTAs agree with that point. I don't know what your experience with CW has been, but I can tell you that *I have* experienced some of those advantages.

>Then when someone who sees their post attacks these so called advantages or

>
>
Did I sing the virtues of CW in my post to him? Answer, No. Did I say that CW testing should stay as a requirement? Answer, No. Your point, mute.

The words "most" and "all" in the previous sentence make it an incorrect statement.

> Then when someone who sees their post attacks these so called advantages or
> claims on the newsgroup or points out that the Mode has declining support
> or that the advantages that the Pro-coders attribute to the mode may not
> always hold up to close scrutiny. These operators are attacked and your side

If their assertions were as accurate as the first sentence above, they should expect to receive some comments adverse to their point of view. Much of the problem on the newsgroup derives from people overstating their case. In doing so they exaggerate and makes erroneous statements. Most reasonable people see these errors. The hotheads simply retort by making equally ludicrous remarks in the opposite direction, IMO.

Dwight Stewart wrote
>Therefore, Mr. Jones would have to be really ignorant if he did not
>understand who and what I was talking about in that message.

Here's your *exact* quote Dwight:
>>Actually, I think the idea of reducing the code test requirement
>>induces a jealous reaction on the pro-CW side.

My translation of that statement is that you think all hams who like CW
(pro-CW) will have a jealous reaction if the code speed test is reduced.
That is not true. Many of us are pro-CW and would like to see the code speed
reduced. I corrected you because many people don't or can't differentiate
between pro-CW and pro-code test. I thought you were one of them.

>then his suggestion that I did
>not "understand the players" could only be taken as an attempt to
>distract from my comments by belittling me.

If you stand by your original statement, then you truly don't understand
the players. If you made an error and meant to say "pro-code-test side"
instead of "pro-CW side" then why not just admit your error?

>I really hate these damn code testing debates. I'm sorry that I ever
>posted that first message. I should have known that I would have to
>post half a dozen messages defending my comments, no matter how neutral
>those comments were.

Incorrect assertions, no matter how neutral the writer thinks they are,
are subject to correction. If you are sensitive to belittling, then set the
example and don't practice it by publicly speculating on my ignorance...

I have answered your questions below...

> I am looking at an amp that runs one 8950 driving three
> other 8950's.

Ouch.. 3 to 4 hundred dollars when it comes time to retube! And that price will only go up.

>
> I know that the 8950 tubes are priced out of sight but am
> told that with a filament change from 12v to 6.3v the Svetlana
> 6KG6A/EL509 is a direct replacement. True?

Yeah, if you can figure out how to put a 9 pin tube in a 12 pin socket!

The 6LF6, 6KD6, 6LR6 and a couple other tubes will work (you can also put another number in place of the first "6" for filament voltage) provided you rewire the sockets.

The EL-509 from Svetlana is a 9 pin tube, though, and has larger than normal pins, necessitating changing out the sockets anyway, if you want to do a proper job. I use it to replace the 6LQ6 / 6MJ6 / 6JE6 tubes, but even that is not for the amateur to do.

>
> If more than the filament voltage needs to be changed, what are
> the other changes, please?

1. Change the plate inductor to make up for the difference in output capacitance of the tube.
2. Rewire the socket to accomodate a different type of tube.

In a nutshell, you build a new linear for the substitution you are talking about, using the plate and power supply components existing.

>
> What sort of average peak SSB output should I expect? Not
> momentary whistle or shout swing but solid voice output power?

For the EL-509 look at 100 watts per tube PEP on AM, 100 percent modulated. That works out to 25 to 30 watts of carrier each.

On SSB, double that.

>
> I am also told that the 6KG6A/EL509 tubes run about $20. each,
> anyone have a better source if I buy 4 or 8 at a time?

20 bux a piece is chump change by todays standards. If you can get a linear for those tubes, be happy...

I would suggest a two tube 572b amp, though..... Better tubes, more dissipation (a single 572b has more dissipation than the three EL509 tubes... Nearly DOUBLE!) and they are designed for RF, not audio.

Greetings!

Well, I'll see what's left in the Checkbook!

Thx!

Hi-5 to Shadow for me!

While Dancing with the Mouse on Wed, 24 Nov 1999 05:59:11 -0600, the
Modem interrupted with an MNI from ""Toll Free"
<tollfree@bigradios.com>", and the MotherBoard buffered this to Video
RAM:

Ditto Bill,

Old techs like us never die, we just get "re-tuned". Keep up the good work and don't let these new guys bother you. Hey, we can still use the old equipment as well as the new. That's more than I can say for most of my competitors.

--

Regards, Mitch

Go to the President radio site and click on the photo for the Lincoln.
The President Lincoln and the HR 2510 are the same radio for the most
part electronicly, and differ looks wise only in color scheme.

Is it true 123 the is no longer affiliated with X-Force this is the latest
news i have heard, since 123 was the main man behind x force getting there
start he brought davemades technology, customers, suppliers etc with him.
I am assuming he is not needed now ? perhaps #12 is now on the payroll.

Morse Code is officially DEAD. There will be no official monitoring by any government stations here or abroad. Technology has put this horse to pasture. In short, Morse code has outlived it's usefulness. My personal prediction is it will eventually be done away with altogether as a requirement for full HF privileges. IMHO, broaden the voice allocation bands and retain a portion for those who wish to carry on with their cw contacts. Personally, I could care less WHAT they do. I 'm a freebander. I know the risk and accept it. All you RF cops, save the flames.....it's water off a duck's back.

The photo is a TRC-485 that I got off of the RS site a while ago. I haven't updated it with a Sidewinder 400 pic yet but since they both look the same maybe I won't. Anyway, thanks for advertising my page Jason, I really liked the attention it brought.

As said before I have no problem with its use on the bands or the right of either side to attack or defend the mode, use it on the bands or attempt to sell it to the rest of the newsgroup or to other Amateurs. It makes little difference to the rest of us on this side of the argument.

Nor did I contribute to you any of the statements in question. The problem is many pro code supporters like I said want to be able to sing it praises tell the rest of us why the mode has to be preserved but take exception if any one challenges those statements.

State what your think are the technical merits, push traditional use of the mode etc. Just don't take offense or try to limit the other fellows options

or right to attack those statements and then claim when he does that he is
trying to eliminate the mode from use on the bands.

ex-KF4HMN

Right. I will oppose any who suggest that we have to take an FCC exam while wearing Star Trek outfits. If you want to wear one, then fine. If you want to wear one while operating your favorite mode, then fine. But don't try to make the rest of us wear them.

Your probably closer to the truth than anybody here. Code will probably
be capped at 5 wpm due to international restrictions (tobe lifted at the
earlist possible WARC). No lectures, you know the rules, happy
thanksgiving.

I don't like buying refurbs, but that seems like the better choice of the 2
here. You could be baying 140 bucks for a smoked radio, or for one that has
been cut up inside beyond hope. If I was in your shoes, I would go ahead and
buy a BRAND NEW Grant XL from EXPORTSRUS or Coaxkid.com; or a Texas Ranger
696 from Coppe for 129.99. The TR 696 is a great radio and maybe even a
little better than the Grant. They are all great radios but 130-140 for a
used one seems a little on the high side.

It will be crystal swap. Digital readout will read off 2 mhz and power output and sensitivity may suffer somewhat unless retuned. No 'easy' chip mod., from what I am told. Compare the schematic of the 485 to the HTX10 and you will probably find a difference in mixing crystal complement. If you are interested only in sideband (is there any other mode?) then buy a HTX100 and do the LSB mod----they are going much cheaper lately now that the HTX10 is on the market. Just worked Sakhalin Island (Russia) mobile with my old HTX100 on 10 m 28.509 mobile tonight---not bad for a 100 dollar used radio with a 2 dollar antenna!

Think of this... if you are going to modify it, or have it modified... what is the point in buying new? Just something to take in consideration.

I would go with the Uniden Grant XL, an older model if you can locate one. Although the Cobra 148 GTL and Grant XL are VERY similiar, they are at the same time, very different.

Charles Golden wrote in message
<19991124232737.16524.00000111@ng-fp1.aol.com>...
:>I don't like buying refurbs, but that seems like the better choice of the
2
:>here. You could be baying 140 bucks for a smoked radio, or for one that
has
:>been cut up inside beyond hope. If I was in your shoes, I would go ahead
and
:>buy a BRAND NEW Grant XL from EXPORTSRUS or Coaxkid.com; or a Texas Ranger
:>696 from Coppe for 129.99. The TR 696 is a great radio and maybe even a
:>little better than the Grant. They are all great radios but 130-140 for a
:>used one seems a little on the high side.
:>
:
:Most of the time around here though, at a pawn shop a $140.00 item can be
:bought for 90-100.00 cash. They also if you talk to them right will give
you a
:short warranty on it. I was kind of leaning that way but I have not
decided
:completely. I have bought 2 radios from pawns before and had very good
luck,
:but maybe that may not be the way to go in this case.

Greetings!

Well, hopefully, this takes care of those problems you've had.

As Toll said, and perhaps many others, take the time to make a friend and they'll reward you.

You're out $65 bucks, no big deal - stick around!

You, like many others, have got a bum steer at least once in their life. But, I'm glad to know that problem has been fixed.

It may not be a bad idea to be a well informed consumer. Had we known about your predicament *before* you bought the radio, you might have found another radio eventually without the headaches.

Take some time to read about some of those "mods" that people post out on the net for different radios. You'd learn how to undo it.

Maybe a book or two about radios can also help you be better informed for choices you may have to make.

While Dancing with the Mouse on 24 Nov 1999 08:48:21 GMT, the Modem interrupted with an MNI from "iceshark@aol.com (ICE SHARK)", and the MotherBoard buffered this to Video RAM:

:+> I want to take this post to apologize to all the techs on this group. I took
:+> your advice and took my saturn to my local tech here in wash state. I was
:+> amazed at watching him find the main problem whitch was a cracked edge of main
:+> board splitting a trace. He fixed it along with some other hack jobs he said
:+> were typical of do it your self mod book techs. He showed me around the
inside
:+> of the radio and tuned it up and took care of bad mod job and week solder
:+> joints. All this right on the spot at the same time he had 3 truckers come in
:+> with varios other radio problems and he fixed them all as they waited. To top
:+> it all off he only charged me
:+> 65.00. well worth the work done.
:+>
:+> I stand corrected on my past comments. You techs are a needed and greatly
:+> appreciated bunch. If not for techs I would be talking on my old radio again.
:+>
:+> Also I gave tech an extra 10.00 as a tip for fast work and he woulnt take it.
:+>
:+> again sorry all.....
:+> Have a happy thanksgiving.
:+> From the now tech loving happy saturn owner.
:+> Tod Kertz

Regards!
:+> Andy <+:

>
>

There is little motivation to develop mods for FRS. The radios only go 1 mile under average conditions....two miles under ideal conditions.

Raising the power does not significantly increase the range and only drains the batteries faster. Moving Amateur gear from 440 to 465 decreases receive sensitivity. Finally, as you will discover quickly, nobody on FRS wants to chat with other folks outside their "group". It's all families keeping in touch at the mall or as they drive down the road. And if you're meeting them on an Interstate Highway, you are in range approximately thirty seconds. Big deal!

Besides, why bother with FRS mods when there is a companion radio service (GMRS) which allows outside antennas and up to 35 watts?

QRM

Thanks for the positive feedback. I do want to note that the person on the group that I got radio from is very honest and I believe
it was the person he got it from that screwed it up.
In fact for my trouble he sent me a like new silver eagle. He didnt have to do that, but it was much abliged.

Have a great thanksgiving
Tod Kertz

I am looking to get a new cb radio. I am trying to decide between a Uniden grant which is available refurbished from the uniden website for $132.00 and a Cobra 148 gtl which I can get pretty often at pawn shops for around $140.00. My question is which is the better radio. Maybe if I get it from a pawn I will get lucky and it will already be peaked.

Check out my ever changing classic video game trade/want list along with my collection here.

>I AM NOW CHARGING FOR ALL MODS FOR CB RADIO'S
>
>   THANKS

why should anyone pay for mods when all they have to do is enter "CB RADIO FREQUENCY MODIFICATION INFORMATION" into
Dogpile.com and get 8 to 12 search engines with multiple sites with pictures and text?
if you enter the specific PLL, most times you go right where you want to be.

MC 10kw Jesus I must say thank you because I had no Ideal! I Will definitely
check it out when I set up my new system. I guess you can find good inf. on
these things.

Yo ProZac,

'round these parts you can get Times LMR-400 for less than Belden 9913. '400
has lower loss, a tighter bending radius and it doesn't suck in water like
9913. You can use the same connectors too. Another good one is the Cushcraft
equivalent - about the same price with the same spec's as '400.

Are there any cool CB sites with pictures of bad ass mobiles and stuff.
I love looking at pictures of peoples set ups. Or just pictures of big boxes
or under the hood pics, or anything.

I know where a lot of them are but I need to find some new ones.

>little better than the Grant. They are all great radios but 130-140 for a
>used one seems a little on the high side.
>

Most of the time around here though, at a pawn shop a $140.00 item can be bought for 90-100.00 cash. They also if you talk to them right will give you a short warranty on it. I was kind of leaning that way but I have not decided completely. I have bought 2 radios from pawns before and had very good luck, but maybe that may not be the way to go in this case.

Check out my ever changing classic video game trade/want list along with my collection here.

I have been trying to get a contact in the us for about 4 years now and the reason that i havent is because wen the skip is running from the us there is always someone on 27.555 playing music usualy using 1kw power, I thought that you guyes kept that sort of thing to freq 26.965-27.405 (our equivilant is) 27.60125-27.99125 and if i do find an op that is on another freq or can get over sed musician all thay are doing is bad mouthing the AT group (whats wrong with them?)

I know that as usual its only a bad few that give the rest a bad name (unfortunatly thay are the only ops I can here)

Davie 108 RI 041

P.S. I am not a member of the AT as I am a comitty member of my group but thay have all been very friendly with me.]

P.P.S. I apologise to the ops on this group who do not fall into this catagory.

I can feel the heat from here (flames flames flames)

I am aware of what he asked, and I offered my opinion of something I consider
to be as good or better

> no wait means- no busy <
```

I disagree. No wait means production is where it should be.

>From: "Þ®özå©625™" That is exactly what IM saying! And if they are busy and still filling orders they are throwing rush jobs out the door is that what you want?<

I disagree with this also. Just because guys work hard to keep up with demand, doesn't mean they're "throwing rush jobs out the door". I have had over two dozen units pass through my hands, and not one defect.

To bad the judge doesn't know what he is doing.  rec.skiing.alpine is
NOT and Internet "site."  The Usenet newsgroup rec.skiing.alpine is
basically a network path that leads to many thousands of privately
owned disk drives, the owners or which have the right to put whatever
text they want on them.

This is ridiculus....

>start he brought davemades technology, customers, suppliers etc with him.

I can't speak for customers or suppliers, but the technology has been around for decades. If you'd like to claim he spent several years learning, and used his education and ambition to start his own company building a product to his standards, then that would be an accurate statement.

>I am assuming he is not needed now ? perhaps #12 is now on the payroll.<

123 is an integral part of X-Force, and always will be. "#12" as you call him, is not nor has ever been a part of X-Force for monetary gain.

Sounds like a lot of coveting, rumor, and gossip going on around here.

Get a firestik an drill a small hole on the edge of the rear bumber. The firestik can be hard mounted right into the hole with a bolt going on the underside. Put the antenna on the side of the bumper that allows you to open the tailgate. When you mount the antenna, make sure you have metal to metal contact betweent the base of the antenna, and the metal bumper. Then, you can run the coax from under the bumper into the cab through any hole you find.

You've reached a new milestone in unrealistic "cause and effect"
scenarios. Do you expect anyone to believe that because the ARRL Board
voted not to support a code-free class of license that the FCC punished
amateur radio by taking away part of a band? Coincidence? No,
absurdity.
You HAVE been reading 73 Magazine as your only source of amateur radio
news, haven't you?

You claim that Morse testing is outdated is under debate. I don't
believe it is outdated. Many others don't believe it is outdated. If
we all accepted your view, there would be no debate at all.

> A "modern" reason. Ok, with the advances in communications technology
> (Which was developed outside of ham radio while hams relaxed in their

You now have a problem with DXers/DXing? You believe that all hams are
DXers? You believe that all hams have easy chairs in their shacks?

> it is no
> longer necessary to use CW, in all but the absolute extreme conditions.

Necessary? It isn't necessary to become a radio amateur. It isn't
necessary to have turkey on Thanksgiving.

> Since there is little that CW can give you over other digital modes or

> voice, and that there are so many modes that a prospective ham may
> choose, it is no longer necessary to know morse to operate a ham radio
> (This is not the 1920's).

Thanks for pointing out which decade it isn't--Damn, I have to get some new calendars! CW is a mode of common use. Many amateurs cannot or do not operate any other mode. An HF license permits you to use the mode. Use of the mode requires some skill. The need to demonstrate that skill is mandated by an international agreement.

> Note that the key word is "necessary". What

> order to play with their latest digital QPSK or QAM project, on the air,
> that they have to learn an archaic telegraphy skill first.

AM, SSB and FM are old modes too. Are you advocating that we use only modes developed after a certain date? Prospective hams desiring to "play" with their QPSK or QAM projects on HF need to pass a morse test, as "archaic" as it seems to you. I can just hear you speaking to your history teacher, "Why do we have to learn this history stuff? It's archaic!"

> This stubborn dogma is what's killing ham radio. If we can't let go of

> from now. But to do that, we have to move with the times.

There is no evidence that amateur radio is on its death bed. It is not necessary to dispose of the past in order to move forward into the future. That is simply flawed logic on your part.

> No one is suggesting that the usage of CW be discontinued, only the
> requirement for having to know it, to be changed. It makes little sense,
> for people desiring HF VOICE or DIGITAL privileges, to have to

> bands only. At least it's related to the mode that you desire. Would it
> make sense to you to be required to know how to swim, in order to
> qualify to ride a motorcycle?

What CW bands? Those on 6m and 2m? You say that the use of CW is not being challenged yet you continue to use terms like "archaic" and "outdated" to describe it. I can't speak for others but when I read your words, I find you less than genuine.

>
> > > CW is a MODE, like SSB, AM, FM, SSTV, AMTOR, PACTOR, PACKET, FSTV, RTTY,

(26) Assorted 6BQ6/6CU6 sweep tubes, USED / TEST GOOD - $20 ALL

(16) Assorted 6DQ6/6GW6 sweep tubes, USED / TEST GOOD - $ 25 ALL

(5) Assorted 12DQ6 sweep tubes, USED / TEST GOOD - $15 ALL

All of these tubes have been tested on a B&K 667, and I have verified that they all test strong, have no grid emission/gas/leakage, and have no shorts.

I have tons of other sweeps (6HB5's, 6JE6/6LQ6's, 6JS6's, 6KD6's, 6LF6's, and lots more). Some are NOS / NIB, some USED / TEST GOOD. For the complete list, go to;

I am going to buy a frequency counter for a TR 699WX. Who makes the best 6 digit counter? Can they be adjusted like the internal Ranger counters?

Hi all,
I just picked up a Connex 4800 DXL and I was wondering if anyone had
one and your general feelings were i.e. problems etc.
So far I'm happy with the radio it talks very well and the freaq
coverage of 24.265 - 29.655 is nice

Dave

Just got an RCI 2950 modded for 26-32. I noticed that its freq display is off by 200 Hz. The radio transmits 200 Hz below what it reads on the display, according to an external freq counter. I'm wondering if this is normal for this radio or is it indicative of a bigger problem (alignment, etc) that may need looking into?

Thanks,
-RC

Don't take out a couple of words from a sentence and than attempt to twist the meaning of those words. A sentence is one complete thought, not pieces of thought that can be ripped apart and attacked individually. I clearly established the meaning of "pro-CW" in that sentence when I used the words "code test" and "side."

The words "code test" clearly means that this sentence was talking about the code test debate. The words "pro-CW side" clearly shows that I was talking about those on the pro-CW side of that debate.

And, since that was the very first sentence of my message, and I used the word "test" in that message many times, it is obvious that my entire message only talking about the people involved in that code test debate (not CW users in general).

All this is reinforced further by the fact that I was responding to a message about the code test debate.

Now, I'm sorry, but if you cannot see that, you obviously need to take some serious classes in reading comprehension.

Good day, Jones. I'll ignore the rest of the pompous, self-righteous, garbage in your message.

Much of the stuff I described happened years before the 'feds' paid any attention to BBS services, and on BBS'es that offered no controversial subject matter. However, like you suggest, I'm sure the situation is even more common now that the 'feds' are occasionally paying attention.

It wasn't all that "clear" to us Dwight. That's why we responded the way we did. My reading "comprension" is as good as the next guy's, and I had a difficult time following the logic. But thanks for clearing up your meaning, I am appreciative.

Perhaps you misunderstood what he wrote, Tim. Nowhere in his message did he say anything about "dx groups," or callsigns from "dx groups." He wrote about "SSB Operators either operating in the 40 channels or Freebanders." And he wrote about searching for a "27 MHz station" on a database. But, again, he did not write anything about "dx groups," or callsigns from "dx groups," in the message I responded to.

If that got you irritated, Ron, try reading his web page (the CB one). His spelling on that page will really get your blood boiling. ;-)

>
> Toll Free

Not true, Toll. The rules changed several years ago. You do not need to have a license in your possession to operate your equipment. You must have a valid callsign, listed on the FCC database, to operate equipment in the Amateur radio bands.

New operators, for example, may begin operation as soon as their callsign appears on the FCC database. They do not have to wait for the actual paper license to arrive by mail as they did in the past.

Today, the FCC considers its database to be the final word when it comes to who has a license - the paper license itself is not longer valid proof for the FCC. At this point, the paper license is only evidence of a license for those outside of the FCC.

hi davie, you and i are friends from icq but i must say if youve not made a contact in 4 years theres a problem on your end. maybe the antenna is too low or your power is but its something. we hear 108 division stations a lot hear and work them too. the AT group is not taken too well here in the USA simply because we have a different mentality than the european dxers. we dont enjoy groups with too many rules and always trying to tell us what to do. here in the states people are way more independent and just as likely to use a made up callsign as one from a large group. the only question i have for you is if 555 is too busy why dont you try calling on 26285 usb? this would only make sense since its fairly active and the qrm is almost always lower. good luck dx'ing.

>
>I have been trying to get a contact in the us for about 4 years now and the reason that i havent is because wen the skip is running from the us there is always someone on 27.555 playing music usualy using 1kw power, I thought that you guyes kept that sort of thing to freq 26.965-27.405 (our equivilant is) 27.60125-27.99125 and if i do find an op that is on another freq or can get over sed musician all thay are doing is bad mouthing the AT group (whats wrong with them?)
>
>I know that as usual its only a bad few that give the rest a bad name (unfortunatly thay are the only ops I can here)

><<activations on several bahamian islands.>>
>
>Is an "activation" a "dx-pedition"?

unfurtunetly now days on the 11 meter band there are many activations that cant be considered true expiditions because many do them just to recieve the 1 dollar sent as a contribution for the qsl. the station i was reffering to in the bahamas is a expedition, yes.

Greetings!

Well, there are a lot of "Techs" around here.

Flat River has a good one. [Greenville]

As far as GR-proper, there is only Power Unlimited. They contract out.

Talk to Bear or Brian.

Others, on the CB, are "Pirate", "DC" and "Six-Mil" - they only do this stuff on the sidelines.

Since late 1996' theres been a lot more appliance operators and fewer "Techs".

Myself? Don't ask. [I'm not trying to be mean - just realistic.] I don't mess with radios enough to really be called a "Tech" except when it comes to a particular chassis' and I'm pretty much a Uniden Fan because of the experience I have with them.

My best advice would be to try and learn this stuff on your own. I'm not kidding on that. If you need to take a radio in for repair, many simple things can be avoided a huge cost by simply replacing the part yourself and be done with it.

Because of advances in electronics, the older parts to keep radios from the late 70's thru to the early 90's have to scavenged from other "junker" radios. SMT and SMD devices are too new to have adaquate catalog-reference or even standards.

Radios with SMD/SMT technology from just a few years ago are going to be harder to figure out due to the out-dated cross reference and non-standard [at the time] part numbering. You litterally have to get a schematic to locate the value of the part or it's cross reference typing.

However, there is still support for the older IC's that can be found on the net a good place to go is...

http://www.rfparts.com

So, if problems do arise, or got some older radios that need fixing, take a look at whats wrong first, then decide to take it to a tech.

A lot of times a simple cap or transistor has failed, you just have to locate the part and replace it.

You take chances on "just brining it to a tech to fix" when you don't know the parts that went out. This is where you can get taken.

I bought 2 radios from this guy that he had posted a few months ago. A TRC-458 and a smaller RS TRC-441 base. The condition of the 458 was to say the least.....HORRIBLE! If you do a search on his NG postings on DEJA.com you will see when he posted them. They FINALLY arrived (after over 2 months of shucking and jiving) in an UNPACKED egg carton.....no padding....just the radios dropped in a large box with no peanuts or anything. E-mail me for details on this guy if you have any questions. I rarely flame I person I have bought something from but this guy is something else! At the very least have him ship COD....you might not have to wait over 2 months for your item.

When I key my mic to talk, lights on the radio dim a little. I just had new finals put in my Cobra 29 WXNWST. I am wondering if I can put a big capacitor parallel to the power input to supply the power when it needs it. Like they do to amps in car stereos.

Also my SWR is a little higher now, is that also because of the new finals.

Is there a board I can install myself for roger beep, I dont want it on the mic. I noticed some boards at bills2way.

The person who installed the finals said I had 7.5watts swinging to 50, what does that mean.

Thank you!

Most dealers have the common courtesy to include a printed copy on the modifications for the radio they are selling a customer without extra cost but some like to sell the books and make a little more profit off everyone. No reference to any named company intended, they speak for themselves.

hit the key to fast.

>When I key my mic to talk, lights on the radio dim a little. I just had new
>finals put in my Cobra 29 WXNWST. I am wondering if I can put a big
>capacitor parallel to the power input to supply the power when it needs it.
>Like they do to amps in car stereos.

Not sure about car stereo's but maybe a different power input. Sound like it does not have enough amperage.

>Also my SWR is a little higher now, is that also because of the new finals.

SWR readings can change with higher dk. Thats all I will say about that.
Under a 2 your ok. It won't damage the equipment.

>Is there a board I can install myself for roger beep, I dont want it on the
>mic. I noticed some boards at bills2way.

Get one and try it. Have a very good soldering iron and don't use acid core solder.
If you don't do it right, your local tech will be more than happy to redo it for you.

>The person who installed the finals said I had 7.5watts swinging to 50, what
>does that mean.

Never mind, I was going to go into detail here, but it would not do me any good. There is someone else who can fill you in. Don't want to risk hurting anyones feelings on the NG.

=============================================================
Can you back this up with any proof, my sources "which are pretty reliable"
say he has split  and is now helping build the bulldog line of  amps in
another part of the country.

> I can't speak for customers or suppliers, but the technology has been
around
> for decades. If you'd like to claim he spent several years learning, and
used
> his education and ambition to start his own company building a product to
his
> standards, then that would be an accurate statement.
============================================================
You are right you cannot speak about the suppliers and customers  because
you don't have any idea of what exactly went on, and yes davemades
technology has been around for some time but it wasnt duplicated by any
other builder,  certain ferrite mixes, tuning procedures, combining
tecniques are used by dave and no one elses even mirrored his and none
performed as well as his until 123 who spent  "only 6/8 months working for
him" not years as you claim, left with his new found info. You should find
my statements to be very accurate I was only an arms length away from him on
the work bench and also a good friend of his .
```

```
>
> 123 is an integral part of X-Force, and always will be. "#12" as you call
him,
> is not nor has ever been a part of X-Force for monetary gain.
===============================================================
I agree 123 "was" an intergal part if it wasnt for him leaving dave there
would be no x force, they wouldnt have had this knowledge. I guess we can
say the same about him and X force now.  As far as #12, he wanted to help
the local  x force guys, and make changes to the amp since they really didnt
know how to improve on a already great product and as we all know "#12" is a
very brilliant man.

>
> Sounds like a lot of coveting, rumor, and gossip going on around here.
============================================================
It is only a rumor if you don't know the real story. It is only gossip if
you chose not to beleive it.

VERY VALID POINT AND IS PROBABLY THE REASON NO ONE HAS RESPONDED TO
YOUR POST. 1/2 WAVE MOBILE IS A HALF WAVE MOBILE UNLESS 55 IS NOW
MAKING 5/8 WAVE MOBILE. IN THAT CASE IT WOULD BE BETTER AND I WOULD
HAVE TO SEE THAT ONE.

I carry mine. It's required that a copy of your license be in your possession whenever you operate. With 2-meter and 70cm rigs in the car and 2-meter and 70cm handhelds, it's easiest to just keep a copy in the wallet...

GOOD POINT
I WOULD ASLO LIKE TO SAY THAT A DAVEMADE UNIT IS PERHAPS ONE OF THE
BEST AMPS ON THE MARKET FOR THE LAST SEVERAL YEARS. SOME PEOPLE DO HAVE
TO WAIT AND AS IT WAS SAID THEY ARE NOT A MOM/POP SHOP. THEY DO HAVE
MANY ORDERS. OF COURSE THERE ARE SOME GUYS ON THIS NEWSGROUP WHO CAN
GET AN AMP FROM DAVE IN A DAY OR TWO (AS WAS SAID PREVIOUSLY), THOSE
GUYS ARE PROBABLY GUYS WHO HAVE BEEN INTO DAVE AMPS WAY BEFORE THE
ADVENT OF THIS INTERNET CB AMP STUFF, HENCE THEY GET PREFERENTIAL
TREATMENT. EVEN WAITING FOR THIS PRODUCT SEEMS LIKE THE BEST THING TO
DO IN MY HUMBLE OPINION.

Phil do you have any idea (I am sure you do) what fixed vacuum capacitors cost ? lets see there are 2 @ 32 kv i'll leave the value out Call Surplus Sales. Then there is the machinist work, not sure that your used lathe can do the work of a cnc machine or as nice of a job, next a jig to bend copper the coil, the t-6 elements 1/2" are 12' long you would need 4 of them, the 3" diamter of 6061 would be needed for the mount, as well as 1' of delron which needs to be machined as well for the reflector mount. When this is pretty much all said and done you can now sit down and assemble the parts . Perhaps you like to work for free phil but i am assuming a small profit is included for time and the know how to do it.
Happy Turkey Day

IS THAT A FACT?
DAMN! WELL I GUESS THERE WILL BE ANOTHER XFORCE TYPE DAVEMADE COPY AMP
COMING FORWARD SOON? WHERE DID 123 GO? WHEREEVER HE WENT I GUESS
ANOTHER DAVEMADE CLONE WILL POP UP.

I recently asked about substitutes for the incredibly costly
8950 tube. I found a discussion on DejaNews about this and
there was a suggestion that 6KG6A's are excellent.

I looked closely at the facts and there seem to be several
significant differences between the 8950 and all of the other
suggested substitutes. I don't understand how a 6KD6 or
6KG6 could be "forced into" a 8950 tube socket.

The 6KG6 is a Novar and I suppose the 6KD6 could fit in the
6KG6 socket but I don't think the 8950 is even close.

I think maybe folks meant that after the amp was modified from an 8950 to a 6KG6 one could substitute a 6KD6 for the 6KG6.

Can someone clarify please?

- Thanks again & Happy Thanksgiving to all! DavidC K1YP

The thing that makes 10M so valuble is that with just a few watts and a poor antenna(unity)There are no 2 points on this planet that cannot be connected with favorable conditions.I wonder why dwight feels this way?

I just worked Lebanon(OD5NH)on 10M SSB with 100 watts and a 4 element Yagi...5x5

  These radios are the same and great radios but forget the refurbs and
pawners,if yiu shop you can get a NEW Grant for that price.

I have 2 Connex 4800DXL radios. I liked the first so much I bought another. They both are LOUD and CLEAR on AM SSB AND FM. With a D104 these radios scream. I had them modded to key 2.5 and peak at 45. No limiters cut. I didn't like that notch on the course tune so I had it taken out. The freq. counter came a little off so I had it re-aligned. Good channel rejection and the receive is AWSOME. These are much better than that joker Delta Force radio that is talked about here once in a while.

What fraction of a T3? I work at an ISP, and my cable modem has better throughput than DSL at a cheaper price. It can be sluggish at times, but when the kids go to bed, it flies. I consistently see 300kbs download and I have no uploadcap at this time.

I can listen to realaudio, surf the web and download huge mp3's at the same time without noticing degradation. Can you beat $42.00/ month? DSL starts at $70.00/month for ADSL (residential).

Happy Turkey Day to all and to all a good turkey!

You are not required to have your "license" in your possession anymore,
the FCC Database is now acceptable, BUT, not a bad idea to carry a copy
since some LEO (not bright types) can't tell the difference between a
scanner or a handheld, CB, Ham or commercial.

I'm thinking about buying a handheld CB radio.
I found a new GE Model #3-5980 for $25
It looks kind of large, but most CBs are big.

Is this one any good?
Any recommendations of other brands or good deals out there?

The TITAN mobile is a 12W pep (no heatsink single final) version of the 4900 Magnum 257 & htx-10. The mod for the 257, Titan & 4900 is also in the ARTSCI "Radio Tech Modifications book" VOL 12B, under the Mag 257. (The HTX-10 has different chip that can't be "unlocked")

Carl you couldnt even spell ferrite before dan came to you , If this was the case my man how come you didnt have this technology before Dan gave it to you ,you should have been making these amps instead of buying them from dave the whole time. Hahah He got it from someone else, you can go around an tell people this but ask dan who sat there and watched him design his amps. He is a engineer unlike you he has forgotten more about electronics than you probably will ever know. You know you didnt get anything from Motorola you can't even read the book nor understand it what it says. You got it from

Dave whether you like to admit it or not. So fuck You and the horse you rode in on. you screwed dan just like you screwed dave. in the end what goes around comes around.
While your at it prove to me whats in the Motorola Book Please list the pages, which version Motorola book you are getting this info from. So that i can find this info on. How come no other amp builders thought of reading this book before. Just you guys. Put up if what you say is true. Come up with something of your own like an antenna system thats not a copy of BB's or anyone elses. you should change your name to XEROX you guys can copy anything . I won't even say anything about the regulators. Hope you choke to death on a turkey leg.

I got an old 3 channel CB for $3 at a garage sale.
It has 2 crystals that are a labeled:

Transmit: 27.125Mhz
Receive: 26.670Mhz

What channel is this?
Is it 14?
Do most CB's use superheterodyne to require a
different frequency of transmit and recieve crystals?

Do they only superheterodyne only on recieve and
not on transmit?

Below is CB frequency table

Chan	Freq	Chan	Freq
1	26.965	21	27.215
2	26.975	22	27.225
3	26.985	23	27.255
4	27.005	24	27.235
5	27.015	25	27.245
6	27.025	26	27.265
7	27.035	27	27.275
8	27.055	28	27.285
9*	27.065	29	27.295
10	27.075	30	27.305
11	27.085	31	27.315
12	27.105	32	27.325
13	27.115	33	27.335
14	27.125	34	27.345
15	27.135	35	27.355
16	27.155	36	27.365
17	27.165	37	27.375
18	27.175	38	27.385
19	27.185	39	27.395
20	27.205	40	27.405

I have one question. Could the CPU from the Titan/257/4900 be swapped
with the HTX-10? Seems to me they used to put the chip from the 2510
into the 2600 in order to mod it. Just food for thought, I don't condone
this type of thing, I'm just curious. 73

Wow! I think I am getting less confused ... a small Thanksgiving miracle!
;-)

Now, can anyone tell me from direct personal experience what tubes they
have directly substituted without mods for the 8950?
Results?

What tubes have you directly substituted for the 8950 with mods?
What mods did you have to do?
Results?

I'm looking at modifying a Palomar 12v Amp designed for one 8950 driving
three and wish to make the mod that generates the maximum output that is
distortion and garbage-free using the existing power supply (changing caps
or
other small components OK, changing transformers is not).

Thanks for all who have already offered helpful info! 73, DavidC K1YP

> There are many possible substitutes but I know of only 1 tube that will
> substitute without heater voltage modification: M2057 (not cheap) Heater
> voltage on the 8950 and the M2057 is 12.6 volts and is on pins 1 & 12 of
> the 12GW socket.
> Other tubes that use the same (12GW) socket but have different heater
> voltage are:
> 6KD6,6LF6, 6MH6, 20LF6, 30KD6, 36KD6, 40KD6 (there may be
> more that I am not aware of)
> Heater voltage is on pins 1 & 12 on all of these tubes.
> The 6LF6 may be a good substitute for you if can reduce the heater voltage
> to 6.3 volts. Bry

>
>
> Sounds like you are on a 'merry chase' on the 8950 sub quest.
> Here is the little bit I know. "Sweep" tubes derive the name from TV
> application only. It is actually a "horizontal output tube". Tube
> drives a sweep/HV transformer which drives the deflection coils on the
> neck of the CRT which deflects the beam horizontally. Vertical tubes do
> the same thing except for the HV work. Why one is called a 'sweep' tube
> and the other a 'vertical' tube I don't know. As a result of this, just
> about any 'sweep' tube will work, electrically, for just about any other
> sweep tube. Base and internal connections are different. Plate
> dissipation will be about the same for all - 30 to 35 watts. Capacitance
> will be slightly different but can be compensated for. Transconductance
> will be comparable. Dynamic plate resistance will be comparable. The
> reason one might work better in a given application is that the
> characteristics are matched better. The 12 pin 8950 has some internal
> connections to pins which are open on other tubes. That is not a problem
> - simply add an external connection to the socket pins. These tubes will
> all plug into the 8950 socket and, with careful attention to
> neutralization etc., will work just as well: 6LB6, 6JS6, 6KD6, 6LF6,
> 6LX6, and 6LR6. I say this with 'tongue in cheek' as I do not have
> specification data on many of them. But they are all sweep tubes, all
> have about the same characteristics, and all have the same 12 pin base.
> Of the ones where I do have data, the 6JS6A and 6LB6 draw 2.25 amps
> filament current. 6KD6 draws 2.85 amps. Well, here are the specs:
> Ih Cgp Cgk Cpk Zp Gm Ip Ep Pd
> 6JS6A 2.25 .7 24 10 5.6K 11.3K 570 990 30
> 6KD6 2.85 .8 40 16 6K 14K 750 990 33
> 6LB6 2.25 .4 33 18 6.6K 13.4K 560 990 30
>
> I can not speak accurately about tubes I've never used. But I can say
> with confidence that any of those tubes will work, and, with attention to

RS doesn't sell amps capable of 11 meter use. Try www.coaxkid.com I just bought a Palomar 225 from them. They offer good prices, fast shipping and a REAL 30 day warranty/return policy, and good support.

If X-Fore offered me a 64 pill for my Dave made 32 pill I wouldn't take it.
In the long run I know all the copy cats will get what they disserve
(nothing) and Dave Made will always be in a class all buy it's self.

Dave is already putting out new products that are his own disign like
digital bird meters, and stuff. Can the guys at X- force have me one of them
that does all the same functions as daves? If so how fast can I get one I
would like to compair them.

Well you did make me eat my words.

I'm of the opinion that if you're in the manufacturing game then with
overheads one has to double one's money at an absolute minimum.

I take it this is a mobile 1/2 wave design?

Are the cap's to bring the feed impedance up to 50R?

I was unawares that one needed any capacitance on frequencies around
27MHz but I only have experience of loaded 1/4 waves where the chassis
is the other half of the dipole and only from around 14MHz and down does
one need shunt cap's or tapped inductor.

Can one drive down the street with these monsters on top or are they
strictly for shoot out use?

Phil / UK

I took my little 4x4 down to my friends farm. On the way, my little 5 year old 2 pill Texas Star was heard in California! The River Rat in Southern Cal heard my little TRC-422 with a Uniden Stock mike! With my KW-7 Firestik on the back bumper, I was talking all over the place. If anybody heard me reply here. Conditions were awesome today.

BTW, I heard Mod Squad a few days ago on ch 11. He was booming!

Happy Turkey Day! Time to chow!

There Are No Substitute's For The 8950 Mill Spec 8 Volt Tube....
Most Others Are Not Even 8 Volts
The 8950 Was A Mill Spec Sweep Tube Used In Several Amps Palomar, D&A Etc.
And The Siltronix Radio's In The Finals And A Few Others.
73's W5IDX
Good Luck.

> well how about posting the sites you already know

Well my favorite sites are probably the most well know site on the net.
There are many other sites I know of that I don't wish to plug.

www.angelfire.com/nj/earplugger Often updated Keeping the band all tied up award. I think I like this site cause he is from NJ?

http://members.aol.com/davemade1
Some of the Dave Made Mobiles, and Hawaiian hall of fame. Also from NJ.

www.davemade.com more Dave made pictures

www.bayshorenetwork.com pictures of my stuff & new ones coming real soon. IM also from NJ

These are the sites I frequent the most! But like I said there are many other sites I know of that I don't wish to plug.

Please post your favorite CB sites.

As I said...just a thought. It would be interesting to know if the
boards and other components are the same. I personally don't need too,
and wouldn't mod my HTX-10. As for others, right now, you can still buy
the modifiable radios. This may not be the case in the future...think
about it.

Well, the original poster was next to a bear when he lit up his Ham
Radio and the bear evidently pulled him over.  Seems Mr. Bear heard our
friend come through his radio (Probably cheap VHF).  Bears are showing
more curiosity about radios lately.  MY OPINION-more radio shenanigans
on VHF and UHF Police Freqs have made them wary.  Your right, nothing is
illegal until caught as my pop said.  However, bears aint't stupid. I
always use the CB for road info, I like to spend my $ on family not
supporting the local revenue enhancement scheme.

Dognottt@my-deja.com, why in the hell did you flame me through E-mail and not post your letter? Could it be because you accused me of being a "looser" (and, by the way genius, it is spelled l-o-s-e-r) because you are too ignorant to perceive that what I said is true? I did not slam any one or say anything about cw that could be misconstrued as negative. I simply stated that there is no official monitoring by government agencies anymore. I didn't disrespect cw, you fool. I guess it was the fact that I stated I was a freebander that got your little pink panties in a wad! I also never mentioned using an amp or a power mike for that matter, those were YOUR words, not mine. Don't worry about me having to pay a fine there, Einstein, because I am more than willing to accept any consequences that come my way for my actions. If you can't do the time, don't do the crime. As far as why I am not on a REAL computer (why in the hell this would concern you, I have no clue) is none of your business. But since you are such a nosy bastard, I'll pacify your whimsical, mindless, inquiry this one time. I don't know you from a can of paint, but I can deduce from your post that you are mentally deficient and in desperate need of education. I'll try. You think I would get out here and post from my home QTH and talk about freebanding and admit to it freely? Some may, I won't. Your ignorance precedes your reputation from here on. As previously stated, save your flames (or at least have half a gonad and post so everyone may read your pitied rhetoric) 'cause it's water off a ducks back. In this instance, you are the duck. MUD-duck! Quack-Quack!

I can't speak for the 2950 made in the last couple or three years. I have an older 2950 that, once I put it on freq., has stayed with almost no trouble.

One of the first things I did was unlock the clarifier so that the tx would follow the rx. Then I realigned the unit.

I have used this radio in my big truck through all kinds of temperature extremes without problem. I had only one problem with it. It had an intermittent problem when the to-220 regulator IC had loosened it's legs from the pcb.

The temperature changes only caused me to shift the clarifier ever so slightly from center during temp changes.(Cab warming or otherwise) And not being the type to worry about centering the clarifier when I talk to someone, the slight offset from center never bothered me. I just tuned to whoever I was talking with and that solves the problem.

M2057.

> Results?

Works fine.

> What tubes have you directly substituted for the 8950 with mods?

6LF6, 6MH6, 6LX6, 6KD6, 6JS6.

> What mods did you have to do?

Filament rewiring and sometimes additional tank capacitance. If you're using the tall versions in an amp where the tubes are vertical, you have to lower the board or chassis where the tube sockets are and lengthen the plate leads. Some of the amps where the tubes are horizontal require mods to fit the longer tubes, and some won't work with the longer tubes at all. The long tubes are 5 inches long, and you need an eighth of an inch of clearance above the plate cap. The 6KG6/EL509 that's reasonably priced is one of the tall types.

> Results?

They work fine.

> I'm looking at modifying a Palomar 12v Amp designed for one 8950 driving
> three and wish to make the mod that generates the maximum output that is
> distortion and garbage-free using the existing power supply (changing caps

> or
> other small components OK, changing transformers is not).

None of the sweep tube amps are especially clean, so don't expect perfection when it comes to distortion. The crap content in sweep tube amps is usually 5 to 10 dB higher than in an equivalent ham amp that uses transmitting tubes.

The 6KG6/EL509 is the most powerful and is available for a reasonable price, but it also requires the most effort to make it work. The sockets have to be changed. They use European 9-pin sockets--not Novar sockets. You can force them into Novar sockets, but the sockets will never hold the thinner-pinned Novar tubes afterward. The 6KG6 is a tall tube; you have to make sure you can fit them in without shorting the plate cap to the chassis.

Personally, I wouldn't spend any money or time on a 12 volt tube amp. They're big, noisy, wasteful, unreliable, costly to repair, outdated piles in my opinion. I've had two 1-driving-3 sweep tube mobiles: a Palomar 310M, and a PAL 350MDX; I converted them both to base amps by gutting out the unreliable DC to DC power supplies and using 117CX Swan power supplies that are separate from the amp itself. The power supply connects to the amp through a jones plug (similar to the Palomar 300A design). With the stock power supply gone there's plenty of room for a fan to help keep the tubes from overheating.

If you're curious and just can't resist making that amp work, buy the cheapest tubes you can get ahold of, play with the amp until you've learned all you can, and then sell it for as much as you can. If the switching transistors in the power supply are still good, and you didn't have to pay too much for the tubes, you may just be able to come close to breaking even when you sell it.

If you need them, I have 6JS6As that will work in that amp (once you rewire the filaments) for $20 each. They are NOS, matched for gain (transconductance) RCAs in their original 1966 vintage boxes. The "A" version of the 6JS6 will produce as much power as an 8950, but has a lower plate dissipation spec. What that means is you have to be more careful when tuning the amp or the tubes will overheat. When tuning the amp for the first time you should have the cover off so you can make sure the peak power output happens before the tuning caps reach either minimum or maximum capacitance. In other words, you want to make sure you can see both sides of the peak before the plates on the air-variable caps (there is one in the driver stage and two in the output stage) are either fully meshed (maximum capacitance) or fully unmeshed (minimum capacitance). If you don't do that there very often is a false peak at either the minimum or maximum capacitace position that makes you think the amp is properly tuned, when in reality the output isn't at maximum and the tubes are overheating because they have to dissipate too much power.

Here's an applicable case history: I put a set of my 6JS6As in a Palomar Skipper 300. The Skipper 300 is a 1-driving-3 amp that is similar to the Palomar 310M mobile amp. When tuning it for the first time I saw both sides of the peak when tuning the driver cap, but both output stage caps ended up at their minimum capacitance positions at what seemed to be maximum peak (modulated) output. The maximum peak output was about 550 watts (measured on a powered, peak-reading meter feeding a dummy load). I noticed that it only took about 10 seconds of key-down time before the tube plates began to glow. I knew the tubes wouldn't last long running like that. I experimented with different techniques to make the the output tank circuit (the two air-variable caps and the coil in between them) resonate with the caps near their half-meshed areas. I didn't want to cut plates off of the caps, so I tried other things. In the end, adding 30 pF to the antenna load cap brought both caps back to near their half-meshed areas. In other words, I could see both sides of the peaks of both caps. The peak output went up to 620 watts and it takes 2 to 3 times more transmit time to make the tube plates glow. The amp went back into service and the customer is happy with it. The customer runs it on low (420 peak watts) to keep the tubes cool and his neighbors happy.

> Thanks for all who have already offered helpful info!

You're welcome. I hope this helps.

I suggest you call Vibroplex ad ask how they gold plate their keys.   They sell
a completely gold key so they send it some where.

For what you want to do you don't need a competition amp. A good quality, biased (AB or B class), mass-produced amp will work fine for multi-mode (both AM and SSB) skipshooting.

Personally, I like the XL-series, Blue Face amps. They have features that you have to pay extra (and usually have to wait) for when ordering a competition amp such as Dave Made or X-Force like an independent pre-amp, switchable SSB delay, bias, and output filtering. They are in-stock and ready to ship at all the popular on-line CB amp distributors. If you really want low cost and low current draw, you can look into the Blue Face 80s and 225s. The 80 doesn't have any extra features, but it is biased for SSB and it has some output filtering. The 225 makes twice as much power and has more features for less than twice as much money. And, since it has 3 power levels, the current draw is adjustable. On low, its current draw is around 5 amps. The Blue Face 225 is the best bang for the buck amp for what you want to do (in my opinion).

And the funny thing, since the DaveMade boys keep bringing Dennis into it, is that Dennis offered his help in the improvements to DaveMade before, and they declined.

I find this one of the funnier things going!

Can you back this up with any proof, my sources "which are pretty reliable" say he has split and is now helping build the bulldog line of amps in another part of the country.

>>>I can. Talked to the people this week about going to Memphis.

>>>123 is still their.

>>>123 has also been helping Sludgehammer build those amps for quite some time, although Sludgehammer has been building them for longer than Danny has been doing X-Force.

You are right you cannot speak about the suppliers and customers because you don't have any idea of what exactly went on, and yes davemades technology has been around for some time but it wasnt duplicated by any other builder, certain ferrite mixes, tuning procedures, combining tecniques are used by dave and no one elses even mirrored his and none performed as well as his until 123 who spent "only 6/8 months working for him" not years as you claim, left with his new found info. You should find my statements to be very accurate I was only an arms length away from him on the work bench and also a good friend of his .

>>>So?

I agree 123 "was" an intergal part if it wasnt for him leaving dave there would be no x force, they wouldnt have had this knowledge. I guess we can say the same about him and X force now. As far as #12, he wanted to help the local x force guys, and make changes to the amp since they really didnt know how to improve on a already great product and as we all know "#12" is a very brilliant man.

>>>Dennis also offered his help to Dave in the past, and was either ignored or refused.

>>>However, one of the things that DaveMade bagged on X-Force for was them having Dennis help in the beginning.

No, he can't.

1. The radio is capable of outband operation out of the box.

2. The radio is capable of +100 % on modulation crests.

3. The radio is non type-accepted for CB use.

Hi I am interested in buying a couple of hand held radios. What are some
good ones in both modes? What is better FRS or CB? Thanks

It's called gold plating....you can take it apart and have somone re-plate
it.......

I've been in CB and Ham since June, 1961. I'm ashamed to tell you how many years it took me to discover that buying a fancy new radio doesn't improve the quality of the people you talk to.......Same LIDS. You're just staring at a different faceplate! Hi Hi.

One of the builders that worked for Davemade went out and started building the
X Force line.  They were at first the same RF Deck, but now there has been
changes made to the RF Deck.  Both product lines work very well.

The 2950 does not hold frequency very tight, especially under various
temperature conditions. You can tune it back on frequency with internal
controls, but it won't stay.

This is one of the radios that I run myself. At 14.4 volts the radio peaks 51 watts with a 3 watt carrier. Have had plenty of compliments on the loudness and clarity of this radio.

The band is great. At 2100z, I worked a "S92" station on 10CW. I don't even know where S92 is! Rig is 100 Watts to a folded dipole in the attic.

I see there are many sites with ways to modify rigs but is there a site for transistor hop ups ? A place to go for quick refferences and part numbers for transistor up grades and oversized replacement for big outputs in rig and even amps ?

E-mail directly if needed.....................

This is because your radio is drawing current and the resistance of your power
leads is actually dropping the voltage a little when you transmit. I would check

that the connections to your battery are good.

> I am wondering if I can put a big
> capacitor parallel to the power input to supply the power when it needs it.
> Like they do to amps in car stereos.

This is a waste of time (and a waste of time with car stereos too if you ask me).

> Also my SWR is a little higher now, is that also because of the new finals.
>

The VSWR should not be affected by the output power. It is a relative reading. It could be that the extra power is making your VSWR meter read more accurately as it is working with higher voltages now.

> Is there a board I can install myself for roger beep, I dont want it on the
> mic. I noticed some boards at bills2way.

I can't comment on these boards 'cuz I don't use them and don't normally talk to stations that do.

> The person who installed the finals said I had 7.5watts swinging to 50, what
> does that mean.

I'm sorry, but I don't agree with the concept of "swing" on AM radios and the method of measuring the power of "swing" is inherently flawed.. Basically, your mechanic has bastardized the radio such that it will over-modulate like crazy. A lot of people find it hard to believe, but when you run your radio with 100% modulation you can talk farther than 150%. I know it is hard to fathom, but it is true. Wildly "swinging" radios sound louder to the locals, but much of your signal's energy is wasted in harmonics that won't be heard by anyone.

Yes Dennis, I can. I have talked with Dan and these private matters don't need
to be splattered on the internet, but what I said is true, he is still X-FORCE.

>> I can't speak for customers or suppliers, but the technology has been

>

Unlike you Dennis, I'm not putting Dave down, nor you. I think it's great when someone takes a basic design and makes it better. That's what Dave did, and that's what Dan did. It's sometimes called OTJT, on the job training. You study, you learn, and if you have ambition, you go on your own and improve.

 >> 123 is an integral part of X-Force, and always will be. "#12" as you call
>him,
>> is not nor has ever been a part of X-Force for monetary gain.
>==
>I agree 123 "was" an intergal part

Dan still "IS" X-Force

> if it wasnt for him leaving dave there
>would be no x force, they wouldnt have had this knowledge. I guess we can
>say the same about him and X force now.

If it wasn't for Dave taking basic linear amplifier design theory and expanding and improving upon that, there would be no Dave either.

> As far as #12, he wanted to help
>the local x force guys, and make changes to the amp since they really didnt
>know how to improve on a already great product and as we all know "#12" is a

well i tell you what i do alot of selling for people in my town...and this guy that i was selling the stuff for he was a person that i had just met and he was living at my house part time because he was kind of been down on his luck and

and didnt have a job at the time and his dad had passed away so i finally had to pay the shipping for the guy because he didnt have even the money to pay for that so he had told me to post them up here on the message board and me trying to help the guy out went ahead and posted what all he had...I post stuff on this message board for people all over the state of Kentucky...but i didnt know the condition of the radios so i had to take his word for it. but i am going to stop posting stuff that others have got for sale unless i have used the equipment then i wont post the stuff for sale. and i apologize for the inconvence my friend caused but i will never will post anything up for sale again unless i know the condition of the stuff and if i have used it.

thanks and everyone have a wonderful Thanksgiving.

David.

============================
Well I asked a question about a rumor I heard and I stand by what was told to
me by a reliable source as private as these matters may be to some others have
no problem about talking about dave and any part of his business why is this
any different? >
>
>Unlike you Dennis, I'm not putting Dave down, nor you. I think it's great
>when
>someone takes a basic design and makes it better. That's what Dave did, and
>that's what Dan did.
===============================
Unlike me?, I am not putting dave down either, I didn't put anyone down but
asked a simple question if 123 has left x force. but the owner of x force
quickly replied to and he didnt deny it in the least. Your comparison of the 2
arent even close Dave did not go to wok for someone and leave with there design
and confidental info. Dan has not improved anything in my opinion, I have seen
some of the latest secret  battle boxes he builds a good clean amp ,as far as
the  class b bias it is not a big deal nor a new revelation. Please don't put
Dan in daves electronic class they are not even close now I like danny but he
is no dave when it comes to rf and electronics.

>Dan still "IS" X-Force
i have heard otherwise

>#12 offered to help. Do you think Dave was born with the information he
>posesses now? Come on Dennis, give this >a rest.
============================
No i know he wasnt born with it he learned on his own accord by trial and
error. He used to modify Texas stars and TNT, his amp looks nothing like these
do. But if you ask xforce 151 anyone can pick up a motorola book and make a amp
that compares to xforce or daves its all in there, he said it was. I just want
to know why it took 123 to go to daves and leave  before anyone thought of this
idea.I asked a simple question what happened to 123 and now a few  x force guys
come out and make a big deal about it. I don't work for dave so why is it a
problem to ask these questions? Double Standards?

This was really directed at Dwight Stewart. The part about the
5 year old Texas Star was aimed at someone who mentioned that
Star's don't hold up. I believe Tim's 112 DXCC contacts because I
have talked all over the world on my CB. Happy DXing.

Yes it is 14 26.670+.455 if freq.
Older radios that used a crystal for each channel did not do any mixing for
the transmit.

Yep, I have a Macintosh. I did some thinking about this after reading your message Scott, and I realised that I do have software like this in my computer. ClarisWorks, which I use for everyday stuff, has a pretty good telecom module built in.

In the past, I used a program called ZTerm. It's probably the best software of this type for the Macintosh.

programmers have already made the y2k mistake all over again. Numerous times.

A good example, the ubiquitous UNIX implementation with 32bit second clocks. This is basically the same problem all over again, a date rollover that screws up all subsidiary date functions.

doesn't have nuttin' tu du wif CB, untill they start putting microcontrollers in them. BIG TYME! hi hi (like those ham rig conversions)

I've answered your question. You may have "reliable" sources, but in conversation with the man in question, you have heard wrong.

Warlok wrote:

BGB wrote:
>Unlike me?, I am not putting dave down either, I didn't put anyone down but
>asked a simple question

You've been dogging Dan since he left. He's not in here dogging Dave for stealing Motorolla's design, Texas Star, TNT

BGB wrote:>Dave did not go to wok for someone and leave with there design
>and confidental info. Dan has not improved anything in my opinion

I don't know who Dave worked for. As I said, he wasn't born with an electronic degree. You don't just dive in and start changing/innovating a design without some knowledge from education

BGB wrote:>Please don't put
>Dan in daves electronic class they are not even close now I like danny but he
>is no dave when it comes to rf and electronics.

I didn't put Dan in that class, but that doesn't mean he couldn't be. Dan is young still, give him time. Those of us whom love radio and rf, will forge ahead looking for something new, something better, and how to get it done. Dave is not the Lone Ranger
nor Bill Gates. I respect Dave for what he's done, and Dan (123), Toll Free,Sean, Dennis(12), Carl (EFJ), John (SledgeHammer), BlueGill, 2Watt, Muddy, and on and on.
Your hangup with "copying" is monotenous <sp>, Dave copied, Armadillo copied, cookie copied, hell, nearly everyone copied something and then personalized or improved or both.
Gees Dennis, put it behind you already.

>I asked a simple question what happened to 123 and now a few x force guys
>come out and make a big deal about it. I don't work for dave so why is it a
>problem to ask these questions?

I thought you did work for/with Dave, hmm, guess I missed on that one. That must make you the Dave cheerleader. I'm not an "X-Force" guy, I just like the people that build them, how they operate, how they care about every customer no matter how large or small. They don't have the "bad attitude" you get from alot of Dave dealers or distributors.
Wm.

Hello David: Here is a web site with a great amount of Beam antenna assembly instructions, parts descriptions, and part lengths.

http://www.majestic-comm.com/maco/support/index.htm

I would suggest caution in trying to make the antenna your self. If its your first time, I would look at all the antennas at the noted site, and look over the the ARRL Antenna Book. There are computer programs the will show how the antenna will work, without assembling it. I use Eznec.

Another thing you will run into, is that the aluminum tubing, run around and tuning time will cost more that the ones already available. Then the next consideration is how to install the beam antenna without it coming down in the next high winds.

Jay at jay123a@qnet.com .... In the Great Mojave Desert, just down the road ah ways from the fillin station.

Hey toll I dont know who Dave works for but I saw something with my own two eyes that cant be found in the bird cat. or any other cat. It is all printed circuitry and from what I hear it is daves work. Is it bull shit? dont know but I saw for the first time from them.
You program which slugs you are using it reads forward & reflected power and SWR.

I really dont know what the deal is with these things because they are not advertised so I might even be pissing them off by talking about it I don't know.

I listen in on channel 11 and 19 a lot and I got a fella in Texas and I'm way up here in New Jersey with a tiny GE hand-transciever. Hope you had a nice Thanksgiving.

<< I took my little 4x4 down to my friends farm. On the way, my little
5 year old 2 pill Texas Star was heard in California! The River Rat
in Southern Cal heard my little TRC-422 with a Uniden Stock mike!
With my KW-7 Firestik on the back bumper, I was talking all over the
place. If anybody heard me reply here. Conditions were awesome today.

BTW, I heard Mod Squad a few days ago on ch 11. He was booming! >>

LET ME JUST SAY THIS... THE REAL DAVE, MAKER OF THE DAVEMADE AMPS, HAS
NEVER AND I MEAN NEVER EVER COME ON THIS NEWSGROUP. TO BE HONEST, THE
ONLY REASON HE KNOWS THIS NEWSGROUP EXISTS IS PROBABLY BECAUSE OF
BOYGONBAD.

krs are you really that stupid . dave  could care less about this NG let
alone post to it but his equipment is less expensive than the x force models
and do the same watts as they claim why not ask them if there numbers are
real.

Toll your jumping in with 1/2 the facts, #12 wanted to do warranty work
for dave nothing else, So why would they need him when they could fix
anything themselves and not have to pay him.

It is a similiar concept to birds but has no resemblence whatso ever other
than them both being digital and being able to read a 30 or 100 micro amp
slug. Birds sells them for $1200.00, his sells for under $300.  He also has
been making computer controlled digital dashboards, tach,oil,volts  etc  for
the local drag racing scene. This is where this idea came from I should know
I suggested the digital watt meter idea after seeing the digital dash

No he is not working for Bird now But he has design some work for coaxial dynamics. He has made his own digital reading watt meter that can be used with bird or coaxials line section. It is computer controlled whereas he wrote his own software for it . It is the same as owning a digital volt meter Fluke makes them so does that mean that the ones radio shack sells are the same inside.

Pardon my ignorance, I am but a lowly newcomer to the ways of the
transceiver. I keep reading these posts concerning a "pill." Can

anyone enlighten me?

I posted concerning my swr's a couple of weeks ago. I was able to solve my problem with a Wilson fiberglass whip. I must admit that I am very impressed with this antenna.

Propagation has been great this week. Spoke to Oklahoma from our West Virginia valley.

The ultimate measure of a man is not where he stands in moments of comfort and convenience, but where he stands at times of challenge and controversy.

----------------------------------------------------------------------------
--------------------------
Again I ask you or anyone on this NG to show me where dave has copied or
used Motorolas design. Prove what you say to be true Don't talk me another
```

asshole prove it. The fact remains you cannot. Show me where his amps resemble TX star at all or tnt you are using words that I said about him modding tx star and tnt to his own specs It is a proven fact x force used daves design wrap for wrap, cap for cap, Why would you argue they did not. This guy builds plasma generators, Broadcast transmitters I guess he copys them to haha. what a joke

> >and confidental info. Dan has not improved anything in my opinion
>
> I don't know who Dave worked for. As I said, he wasn't born with an electronic
> degree. You don't just dive in and start changing/innovating a design without

You are right you don't know he is basically self taught and has no electronic education other than a street degree

>
> I didn't put Dan in that class.

As much as I like dan he is not, nor am I and I don't claim to be, I don't claim to have bettered his amps either but I could build one as good as dan can.

,

> Your hangup with "copying" is monotenous <sp>, Dave copied, Armadillo copied,

==

> Gees Dennis, put it behind you already.

===

I have put it behind me you have repied to my posts regarding this My point was I asked what happened to dan because i have heard some rumors he was not with x force any longer.

> I thought you did work for/with Dave, hmm, guess I missed on that one.

```
That
> must make you the Dave cheerleader. I'm not an "X-Force" guy,
----------------------------------------------------------------------------
------------------------------
I have at one point but no longer. I am the head Dave cheerleader and gladly
admit to it . Your not an x force guy but you sound like there cheerleader
too.

> I just like the
> people that build them, how they operate, how they care about every
customer no
> matter how large or small. They don't have the "bad attitude" you get from
alot
> of Dave dealers or distributors.
----------------------------------------------------------------------------
--------------------
I like one of the guys that builds them too Dan, I don't like how they
operate they will fuck you in a minute if it is for money or to sell there
amp. So I guess you can blame dave for his dealers attitudes  he may sell
them amps  but attitudes are not his specialty

The term Pill is used for the transistors used in CB amps. Such as the 2290 & the 2879 transistors by Toshiba. And also some MRF and other types. They look like a big white pills.
A 16 pill = 16 2879's, A 5 pill = 1 2290 & 4 2879's

Howdy Hank. It's shaken, not stirred. The newsgroup is full of
arguments between competition amp makers now anyway.
I must admit it's fascinating and I'm learning a lot about
who runs what and who works for who.

Are you writing a book? I certainly won't be in the "big boy" chapter.

Well if you think I came on here to mess with people or mess with your so called bandwith your crazy. That was the first post I had ever posted on this board. I posted that the day I found this board. I just wanted an answer if there was one. Not get the whole board fighting. I also stated that I knew nothing about cb's. Dont know what other info you wanted on me. Im a beginner and no nothing. It's that simple. But im not trying to make this into a fight in any way. Just want to let everyone know that the post was legit. I have better shit to do then try and "jerk someones chain". I figured if someone didnt think it could happen or didnt have an answer they wouldnt bother posting. Only the people that thought maybe they did have some positive input on the post. But I found out on here it doesnt work that way. If i made anyone feel like I was just trying to waste peoples time then im sorry.

My website has tons of FRS infoo... including a comparison between FRS
and CB.  It is perhaps better you look over all available info before
making your decision.

FRS uses UHF FM.. which has better sound quality.  FRS allows use of a
subaudible tone squelch to prevent you from hearing unintended
communications.

1. Can the beep that accompanies the pressing of the buttons be tunred off?

2. The sensitivity seems good, but the S/N and NL are a bit weak. Any way to improve these via mods or in-line noise choppers and such?

3. How can the AM mod limiter be disabled while leaving the SSB AMC intact? According to the tech who worked on my radio, this is what he did, but I just want to know exactly how he did it...

4. Finally, what kind of power output should I be seeing in a peaked radio? Currently, I have 2-10 watt deadkey on AM swinging to about 35 max. SSB varies from 15-25. I'm wondering if I should tweak this further...

Thanks,
-RC

Greetings!

No not wrong, just displaying the symptom.

A lot of times a full blown squeal starts out as a low frequency oscillation - which occurs more often than many people think. They just don't hear it because it's below the bandpass filters the radio uses.

Kinda like a 60Hz hum, and gets worse as the volume goes up.

Many cases of this problem, it's like a relaxation oscillator that "winds up" when resistance feedback path goes lower. Turning into a full blown high-pitched squeal.

Good point thats worth mentioning.

While Dancing with the Mouse on 26 Nov 1999 16:19:20 GMT, the Modem interrupted with an MNI from "theweek1@aol.com (The week 1)", and the MotherBoard buffered this to Video RAM:

:+> how if hes running a power mike with every thing down low might not hear a
:+> sqeal still will cause rf back fed just from the radio intrnaly just a though
:+> probaly wrong

High Power 10 Meter Mobile Transceiver
Freq.   28.000 - 29.699
Modes   AM (A3E)/ FM (F3E)/ USB (J3E)/ LSB (J3E)
Freq Accuracy Better than +10 ppm from 0-40C after 15 minutes
Power Req 12 - 13.8 V DC neg ground
Current Drain Receive: Squelched, 0.8A
                   Max. Audio Output 1.5A
         Transmit: 35A maximum

Microprocessor Controlled Radio
Separate Control and RF Decks

150 - 200 watts PEP RF output
Continuously variable power output control
5 digit LCD frequency Display
Back Lit Display
60 Segment S/RF meter
5 Memory Channels
RF Gain Control /Microphone Gain Control
Noise Blanker Frequency Scan
Last Channel Recall
Split Frequency for Repeater Use
Receive Audio Tone Control
Scanning Microphone
1 Year Warranty

Receiver Specifications

Circuit Type	Double-conversion Super heterodyne	
Intermediate Frequencies	1st IF:	10.695 MHz
	2nd IF:	455 kHz
	SSB IF:	10.695 MHz
Sensitivity	SSB/CW (10 dB S/N):	0.25 uV
	AM (10 dB S/N):	1.0 uV
	FM (12 dB SINAD):	0.3 uV (-135 dBM)
Selectivity	SSB:	4.2 kHz/-6dB
	CW:	8.5 kHz/-60dB
	AM:	6.0 kHz/-6dB
	FM:	18 kHz/-60dB
Adjacent Channel Rej.	Better than 70dB	
IF Rejection	Better than 80 dB for all frequencies	
Freq Response	250 - 3000Hz	
Clarifier Range	1.5 kHz	
Audio Output Power	2 watts minimum at 10% THD w/8 ohm load	
Audio Output Z	8 ohms	

The remote RF deck is the power plant of the Magnum 357DX. Separatingg the RF deck and the Control deck increases performance and reduces the chance of RF interference. The Control and RF deck are attached by a 9" control cable with computer-type connectors.

PILL= Reference to transistor finals in linear ampifiers. The greater number
of "pills" the larger the amplifier is.
This is what I got for a term on the site someone gave me when I asked for
CB Slang. It is out of the book "Woody World Of CB" 1962-1998.
Just thought I would share that.

Not exactly...

> Foxie and Skullcracka were students of Dominator which Dominator was a
> student of   Sneaky P. And John Boy Of Memphis,tenn.

However, the Dominator boxes never did anything new. He changed the name,
but the design stayed the same.

The Next Greatest
> Box Builder of All Time Was Slave Boy From Akron,Ohio.

Dominator makes DC boxes. Slaveboy is an AC boy.

Big difference.

 Davemade is just

Yeah well toll knows all so why argue?

I have forgotten more than your 60G education taught you.

For shits and giggles, why don't you bother telling us what the BGP4 routing protocol is, and how to impliment redundancy through it, and how to keep a firewall system running utilizing BGP4 and multiple internet routers?

That is an elementary question for someone who is as good with computers as you are.

Kenwood never made a plate modulated radio..

They where all either low level modulated, or screen grid modulated.

Therefore, the Tram will blow it away. Put an amp on the Tram to get the power levels about the same, and both running correctly, the Tram will eat it for lunch.

Hate to say this, as I run a Kenwood.

Hi all:

I have updated a couple of the pages: Classic CB Radio's,CB Manuals, CB Photofax/ CB Tune-up's and schematic's available. Please check out the following:
http://home.att.net/~j.dow-kb2tlb/index.htm/radiocb.htm <Radio's.

http://home.att.net/~j.dow-kb2tlb/home.html/phfact6.htm <Photofax.

NEW easier to browse, with links from page to page!!.

Tnx,
Jim/kb2tlb

under the right conditions, this is called ducting.
it's kind of like the radio wave traveling through a wave guide as in a
microwave oven or transmitter, only at lower freqs.
i've never heard of the O3 thing either unless it's one of the ionized gasses
up there? if it were less dense, i would think the wave would travel out into
space though.
what ever.
have a good day.

Jason,

It sounds like the master oscillator was not tuned up. Given the other symptoms you noted, I would hazard to guess that this radio missed final inspection altogether. With that in mind, I would've grabbed another one from RS and tried it before throwing in the towel. As for the HR2510, I think you'll find they are out of production now and that the final transistors are no longer manufactured.

Jason Anderson wrote:

> This radio was junk. Bought it on Wed., returned it today. Lossy type receive and terrible SSB transmitting. The heat sink from the finals would heat-up after 2 min. of talking. Was not happy. Cranked down to 6 1/2 watts to drive the linear and it was good then but not by itself.
>
> Display was off, tried 3 different freq. counters and all showed the same results(If you are wondering, the main testing unit was a $5000 HP digital-200 mhz O-scope with 1hz accurate freq. count in it).

This microphone is made by Merry Microphone. I like it personally. Instead of the expensive 7V battery for the unit, you can buy a pack of hearing aid batteries and use them. I forget the battery number off the top of my head, but they are the bigguns that Radio Shack sells. You can probably get them cheaper elsewhere though. When you buy them there should be no tax as they are a health product. Wrap up five of them with a small piece of sticky tape and insert. The battery cover will hold them in place. You can also modify the microphone for considerably higher output. Inside there is a 1k5 resistor that forms the negative feedback for the built-in amplifier. Change this to something with a higher value, say 18k, and you'll find the output comes up in fine style! I had one that I removed both the 22n capacitors and this widened up the output bandwidth a lot. I believe that if you short the 47k resistor together you'll defeat the noise-cancelling function. Unfortunately, somebody broke into my rig and relieved me of mine. :-< I guess I'll just have to get another one.....:->

In short, plenty of tricks with this mic!

MC.

>
hey neighbor, how are ya?
wearing your flack jacket again, huh? or should i say fire proof suit? :)
you are right. there are no more official govt monitoring stations for cw anymore, (except the FCC OO's and field stations).
maybe they know something that the ham community hasn't caught on to or won't accept?
the navy has said that it doesn't monitor cw but if it happens to catch a distress call, they will respond.
to the guy that flash burned you, my opinion is that cw is like riding horses, once a nesessity, now a recreation. same goes for sail boats, bamboo fishing poles, bows and arrows and spears, (javelins).
hams always tout the advances that they have helped make in radio technology for which we all are grateful. i don't understand why they don't let go of the past to make way for the future?
i saw some old magizines that were written just for commodore computers. in them, there were articles written by bill gates. i doubt he has any commodors in use at home. now there's a success story, his legal troubles not withstanding. he didn't let commodore stand in the way of progress but used it as a stepping stone to get where he is today.
and the ham community wonders why their community borders are shrinking year by year in the hf spectrum. the no code license took off when it was established.
if it were me, this would indicate to me that there was a definite shift in the general public's opinion of the nesessity of morse code.
the hams say that if there's a storm or other natural disaster, the code may be needed.
i say in such a disaster, if the antenna's blown down, the code is as worthless as SSB, AM, FM or any other mode
with all of the advances today in radio technology, the code, in my opinion, has become a true dinosaur.
keep it as a pet but don't try to ride it on the interstate.

> As far as why I am not on a REAL computer

i don't know what you use your computer for but for me, if my old packard bell 40 mhz, 8 meg ram, junk video card, 1/2 gig hard drive didn't take a dump, i wouldn't be on this newer, used one now. the best part about it was the 56 k fax modem that came with it which is like putting a truck transmission in a volkswaggon.
my friend that takes care of this thing says that i needed windows 98 and norton utilities.
with all of the new fangled stuff that i have to go through to get this thing to turn on and off, i'd almost format the hard drive and go back to windows 3.1 if i could but the bios won't support it.
compaired to the glider that i had, this thing is like a jet.
i don't do anything fancy with this thing, just cruse the net.
i've not seen any problems with any of your posts so if your happy with your net access then i say keep it regardless what the other guy said.
it seems that the RF police mentality is bleeding over into peoples computer practices.
some people like old tube type radios and still use them and the "state of the art" crowd laughs at them.
until, ofcourse, the first millisecond that they key up into a high SWR. by

then the damage may already be done where a tube final may have been more
forgiving.
have a good day.
jeff

Interested in purchasing a handheld CB + weatherband, mainly for automobile use (traffic, weather, emergency communication on/offroad, etc.), maybe also to take hiking. What's the range of a handheld? Can an external antenna be connected to it when in the vehicle? Looking at a Cobra 45 WX ST. Any recommendations appreciated,

HR 2346 will force the FCC to train the locals to recognize radios.
However, if the locals ever catch on to the "fine" business since then
local courts will be permitted to have jurisdiction, then it could mean
a major change in the radio hobbies.

Just back from a visit to Radio Shack, No HTX-10 in stock, not a "Ham"
store since they don't sell that many amateur radios. BUT there was an
irate customer in there complaining about interference to his TV and
telephone from a high powered station (I am the only ham in the area) so
I guess Billy Tauzin will get another letter from a dis-satisfied voter.

You have to understand that there are a lot of jerks that work for radio shack (or are in love with RS for some reason) that can't relate to an Item being sold by Tandy as being bad in ANY way. These dudes cum in their pants every time Radio shack announces a new "new" house-labled radio or VCR that is either always already being made with another name on it, or is a no-big deal overpriced piece of crap. (the HTX-10 is the same EXACT radio as the Magnum 257 & superstar 4900+ except for the un-modifiable chip in the tandy, I've seen all 3 opened). The stupid part-time salesman read all the company generated propaganda that comes to the store on official Tandy letterhead and repeat the crap back out to US. When "consumer reports" rates some RS item good, they tell you they know it's the best, when they rate it bad, as in the recent consumers that put even "drug store brand" batteries ahead of RS, they tell you their tests must have been "flawed". The HTX-10 is a good price at $140-150, but I'd rather pay $179 & get the model that will do 25-30Mhz. Better than paying $80-150 more for a 2950/Lincoln with similar features & power. "give me your name & address NOW, then swith your phone over TO sprint, then give me another $40 for a "service plan" & I'll take your money & put nothing else in the bag, SUCKER!!"

Hello R Smith9695: The 4 element horizonal should be pretty easy to put together, but can be a real bear to get working, and tuned in. Contact Allen Telecom at:

http://www.allentele.com/antenna/products/.html

They can send you a copy of the Moonraker 4 beam assembly plans, this will be a good start. Also look at the MaCo Antenna web site at:

http://www.majestic-comm.com/maco/support/index.htm

Maybe you can make your 4 element like the MaCo 4 element beam antenna. And you can
probably buy some of the Gama match parts to get it all tuned in, if you don't have
the Moonraker 4 parts already. Ley us know how you make out!

Jay in the Mojave

the "tuning thingy" refered to in the other response is a trim cap.
this will only make a small difference in the freq adjustment.
if you're off by more than a few hundred hz, you may have a bad crystal. which one will have to be determined one ocillator at a time with a freq counter or ocilloscope.
if you are off by multiple, whole channels like 1, 2, 4, 8, 10, 16 channels above or below the intended frequency, you may have a loose solder joint on one of the program lines between the channel selector and the PLL chip, a bad channel switch or a blown program gate in the PLL itself. i was tinkering with a rad shack radio that had a TC-9106 chip years ago. i crossed the wrong leads and fried the chip.
my watt meter showed good output but i couldn't find it anywhere on my pres 2510,
(no freq counter at the time). i took it to a friends house and put it on his and it was putting out 25.4173 mhz on all 40 channels.

a 25 mile drive + $14.00 mistake.
good luck.
jeff

are you trying to blow this guy's radio up?
you NEVER mount a firestick to any metal part of a vehicle without insulation.
if your's were the case, where would he connect the coax shield? to the same
bolt?
the only time you don't need insulator washers is if the bumper is plastic.
then you have to run a ground strap from the antenna mount GROUND to the frame
of the vehicle.

```
have a good day.

code a Dinoaur, its more like a fool trying to drive Model A on I-75 at
5 pm but then you live in the state of fossel (florida). Time for CODE
TO GO, hope to see latest revision from FCC on Amateur Code requirment.
I petitioned for a 5 wpm MAX to satisfy the International Requirement
but the FOSSEL Division wants 20 wpm kept as the standard.

CW hahaha.. i will admitt this i am a ham.. i have passed (just passed) my 13wpm test.. I hate code it sucks and i wont ever use it i dont even own a paddle. I just went and did it because i wanted access to the general lisc and better world wide activity instead of waiting for 10 meters to open.. thats it.. and as a side note i grew my radio ties on 11 meters and think its cool. I dont have a prob with cb.. i talk to my dad sometimes also on it.

explorer wrote that you should mount a firestick to your bumper with a bolt
with direct metal contact between the antenna and bumper.
THIS IS WRONG!!!
NEVER mount a firestick or similar antenna to a metal bumper WITHOUT the
insulating washers supplied with a mount made for such antennas. the directions
should come with the mount.
if you install it his way, you'll burn out your final transistor and void your
warantee.
the stud mounts for these antennas actually are 2 separate connections.
there are 2 different styles to choose from.
there is 1 that you have a threaded sleve that you bolt to the bumper or other
part of the truck and screw the antenna into the other end of the sleve. when
installing the bolt, be sure to connect the center conductor of your coax,
preferably with a solder lug, on the bolt in direct contact with the bolt head.
THIS is your antenna connection. for the coax shield braid, this needs to be
grounded at a conveinent point near the antenna. THIS is the ground connection.
the connection to the bumper, frame, or body must be clean. if you groung to
the bumper, be sure ALL of the joints between the bumper and frame are clean.
if they aren't, at best, you'll have a degraded signal with a distorted
radiation patern or, at worst, you could cause damage to your final transistor.
there should be 2 nylon shoulder washers supplied with this mount. you drill a
hole in the truck where you want to mount the antenna. the hole should be
slightly larger than the bolt to allow the rasied portion of the nylon washer
to set into the hole. the washer near the head of the bolt should be "face up"
and the washer that goes on top of the bumper should be "face down". the raised
shoulders of these washers should both be set inside the hole so the bolt
doesn't come in contact with the bumper. then, screw the threaded sleve onto
the bolt. don't tighten it down so much as to crush the insulators but make it

snug enough so as not to work loose.
then screw the stud at the bottom of the antenna into the top of the threaded sleve.
it is generally easier if you run your coax through the truck before connecting it to the antenna as the smaller end of the wire is easier to push through any holes than the antenna plug would be.

the 2nd type of mount is nearly the same.
it has a stud that screws into the same type threaded sleve but the other end has a socket like the antenna socket on the back of your radio.
this one mounts the same way EXCEPT it only uses 1 nylon washer.
in this mount, the ground connection is made for you when you mount it into the bumper.
the flange at the base of the stud IS the ground connection in and of itself and MUST come in contact with the underside of the bumper. before installing this kind of mount, you should go over the UNDERSIDE of the bumper with sand paper around the hole to get rid of any paint, dirt or rust for a good ground.
if you look at the base of the stud where it meets the flange, you'll see a nylon or teflon insulator that separates the stud from the flange.
BE CAREFUL as you CAN pull the stud right out of the flange by overtightening it.
use the same percautions as the bolt mount above.
be sure to use the shoulder washer "face down" onTOP of the bumper as listed above as this will insulate the stud from the bumper. it is wise to use an ohm meter to check your work. test for continuity between the bumper and the FLANGE of the mount. there should be zero ohms or a full scale reading on your meter. also check between the chrome base of the antenna or sleve and the bumper. it should read infinity or no meter movement at all. if the opposite is true in either case, recheck your work and correct any problems BEFORE you use the radio or damage may occur.
after installation, you get out your coax that has 2 PL-259 antenna plugs and string it through the truck. screw one end into the bottom of the antenna mount and the other end into the back of the radio. which ever mount you choose, be sure ALL coax connections are tight and clean. you don't have to break out the vise-grips but a real finger tightening will be worth the effort.
if you choose a firestick style antenna, it is a good idea to get one that is long enough to extend above the cab of the truck as much as practical.
if you look closely at this type of antenna, you'll see a coil of wire under the plastic outer coating. it can be seen better on the antennas that have a clear coat but the shape of the coil can still be seen under the colored ones. these are top loaded antennas where most of your signal comes out of the top. you want this part of the antenna above the cab so as not to distort your signal. there are many brands of this style antenna out there but not all antennas are created equal. personally, i like, and have used, the firestick brand. it matches and performs well. if you choose to get into the out-bands, for the price, the 7 footer is fairly broadbanded. with cb antennas, generally, the longer, the better. if you only talk on a small group of channels that are clumped together and don't have the need for great range, you can get away with a 3 footer. for best performance, go long.
a heavy duty spring at the bottom of the antenna would be a good investment too, especally if you like to go into the woods, to avoid damage to the antenna or the 2nd style of mount should you choose that one.
there is a 3rd type of mount called a ball mount. this one, by far, is the

sturdiest one of the 3. the down side to this mount is the fact that you have to drill 3) 1/4 inch holes and 1) 1 inch hole to install it. all in an area that is about 3 inches in diameter.
it knocks the hell out of the re-sale value of the truck. much more than a 1/2 hole for a stud mount.

after you mount ANY antenna, another good investment would be an SWR meter.
or, at least, borrow one from a friend.
in simple terms, it will tell you the general condition of your antenna system.
this information is especally important if you go 4 wheeling in the woods where the antenna is going to get smacked around a lot.
you connect it between the antenna coax and the radio. it can be left in the line for continous monitoring of your antenna's condition and, if you get a small enough meter, you can mount it within easy viewing of your drivers seat.
you don't have to watch it, just glance at it when you key the mic. should something come loose, it will tell you, at a glance, when you key the mic. this way, you can avoid damage to your radio.
i hope this helps and happy 4 X 4'ing.
jeff

I need help!!! I have a guy about 1 block away from my house who has a CB and is running about 500 watts on AM. My poor 2510 can hear this prick from 26.000 - 28.000 when he is on the air...Is there anything I can due to cut down the splash? Will it kill my radio's sensitivity for shooting skip? (That is pretty much ALL I do on the radio) Someone mentioned the chipswitch? Would this help?

I'm ready to get sell this rig, if I can find a better radio that isn't such a splashbox...Any suggestions?

What is everyone's fav. sites/chats/etc.. that is radio related???

Here are some of mine:
---http://www.pantherco.com/radiorepair/----Panther electronics,very helpful info especially on message board.
---http://www.qst.net----nice ham radio/electronic links and info.
---http://www.defpom.com----lots of mods and info on cb and car audio.
---http://members.tripod.com/~spacemycase/index-2.html----popular webring for cb radio operators.
---http://www.bills2way.com----nice online site for radio gear.
---http://www.copper.com----website for copper electronics,good site to look at radio's and accesories but not very good reputation for ordering equipment.

I have been given a Hytek Antenna Control box. No rotor,
no manual, no schematic. Anyone have data to share?

There are markings on the label "36V DC R".

The label reads:
TDF Corporation Neosho, MO Serial # 28-633

I'd like to discover if it may be adapted to other rotors or used
for other control purposes.

Hmmm. I've never heard of "lossy receive" either. Maybe its a local slang
phrase they toss around in their shop/lab.

"....equipment that cost more than your car...."

Yeah. Right! Try multiplying your $5K by five or six. Or were you speaking of
your personal exprience, Jason? Not all CBers drive junkers!**

My disappointment with the HTX-10: No CW provision.

QRM

**Note about antenna mounts on year 2000 GM autos. The trunk cavity slopes in, so the standard No Holes Visibile antenna mount won't work unless its flexible enough to be bent. We had to switch to a trunk lip mount for the Wilson when the new car came in.

Since CB radio is now regulated by local authorities, call the local police department if you have evidence that he is "running about 500 watts on AM" Turn yourself in while your're at it, since you are breaking the law using the 2510 too.

Doin' fine jeff, ty. I really do not understand some people. Like I made the rule or something. Hell, I didn't say whether I enjoyed, or even used cw, all I said was it was outdated and they aren't monitoring any more and the dude slammed me! Oh well. Yea, we definitely reside in the land of the newly-wed and walking dead. Hope everyone had a great holiday and caught some of the international stuff that was running all day. What a day! With winter comes the start of my favorite season: DX season. I have heard some cw recently on 10 meters, but after listening for awhile it was apparent no long distance stuff was rolling, just local banter. As I stated previously, I really don't have a strong opinion on it either way, but most of the pro-cw folks' mindset seem to be a "I had to do it and so should you" kinda thing with no real merit. Most of the freebanders I know really don't care either. If they want their cw, fine. If not, that's fine, too. Hell, let 'em fight it out amongst themselves. I'd rather listen to an RF cop lecture me about freebanding than argue this code thing. At least the RF cop's lecture has a BIT of merit(albeit ever so tiny).

instead of offering some constructive help you flame the guy for receive problems. (since when is using a 2510 to receive illegal? take away my icom 751 if you dare.) and where are you located in the u.s. where there is local authority over cb operations? to the original poster, the chipswitch will not help in reducing the splatter you hear. the chipswitch mod is for expanded freq availability and some other items. as far as the 2510 being a splatter box, its actually a fairly narrow banded rig on receive. the problem is your 'neighbor' and his dirty rig and the wattage he is xmitting. there are some cb rambo's out there who have advocated trashing an obnoxious operators coax or even his shack but that does'nt really work try talking to the guy and if he is still a prick then contact the fcc (good luck with that one). dont give up on the 2510's. good rigs that are hard to come by. 73, jim.

OK I've been shopping for a new radio to use on standard CB frequencies... I was looking at the RCI 2950, but what about the 2960, 2970, 2980, 2990? Why doesn't anyone talk about these? Are these the best radios more or less for CB use? And also, where can I find out about modifying one of these radios for CB use once I get one? Any help would be appreciated, thanks guys...

- Johnny

Subject: Blondes are beautiful

A man was in his front yard mowing grass when his attractive blond female neighbor came out of the house and went straight to the mailbox. She opened it, then slammed it shut and stormed back in the house.

A little later she came out of her house again, went to the mailbox and again opened it and slammed it shut. Angrily, back into the house she went.

As the man was getting ready to edge the lawn, here she came again, marched to the mailbox, opened it and then slammed it closed harder than ever.

Puzzled by her actions the man asked her, "Is something wrong?"

To which she replied, "There certainly is!. My stupid computer keeps saying, "YOU'VE GOT MAIL"."

Talk to him and see if y'all can work things out, if not, Get you a 1000
watt amp
and start talking then he won't be able to hear anything but you on all 40
channels
and more.
Good Luck
Tony

I tried a few searches for it and could not find one for the truck stop
or for Stoney Ridge CB Shop.

> slug.

Yes, we all know that their are so many ways to make a digital voltmeter, right?

Geeze... The point was to let Prozac know that he doesn't need to be on the ballsack.

Dave is not a God. Dave did not "invent" the idea of the digital meter. He may have a good design on amplifiers, and have a decent wattmeter.

Birds sells them for $1200.00, his sells for under $300. He also has
> been making computer controlled digital dashboards, tach,oil,volts etc
for
> the local drag racing scene.

So does VDO... Does this mean that he copied them? After all, they are all just digital voltmeters, and the sensors send a controlled voltage back to the indicator. The indicator is programmed to respond to the change in voltage in different ways (speedometer and tach via rate of pulse, the others via change in voltage).

Dave in no way invented this. Although he may have made it cheaper.

The point is, Dave in no way came up with something new.... Neither did X-Force. Neither did Bulldog.. Neither did Texas Star (with the Skeleton).

Hell, I have a Palomar TX150 that will run at 18 volts... Nicely.

It was built before Dave was around.

Does that mean that he copied it? No, it doesn't.... What it does mean is that he found another means to an end. Any of the 70s class C palomars and markos, etc.... will run at higher than normal voltages.

If Danny and company copied the design... Who gives a flying fuck? It was bettered (as the Dave boys point out, time after time, by #12), but not after he offered the same help to the Dave crew.

Before X-Force was on the "hit list", "Shit list" or whatever else, it was No-Name.

Everyone has to have a bitch about something.

The consumer bitches about DaveMade taking so long to get a product to them.

The DaveMade people bitch about people "stealing" their design.

See the justice?

So everyone should just quit bitching. If you want a DaveMade amplifier, buy one and wait. If you want an X-Force, buy one of them and get it in a few days.

Concrete Man out here taking up bandwith rehashing shit that Danny did is just getting plain old. Just like the rest of the arguments about this subject. If you want to know what happened to Danny, call him up.

>This is where this idea came from I should know

Great. You will also remember when you guys where testing the Viagra antenna system on your truck, I told you how to build a remote field strength meter. You said that it was the same as Daves (in theory).

Guess I copied his? Although one was never sold to me?

I am not trying to be a dick, Dennis, I am just tired of the wasted bandwith and the same old shit being dredged up every couple weeks.

I'm sorry to announce that Exports R Us will be be shutting down on December 1st. I've decided to do this because I can't live myself anymore. I can't continue to rip people off by selling them refurbished radios and previously blown up repaired amplifiers. I'm sorry for defrauding people out of their hard earned money. I also would like to say that Dave Made amps are better than X-Force. I was only trying to make quick money and didn't give a damn about quality. Rich

Never said he was. Never said he invented the idea of the digital meter,
just that he is designing his own digital meters. See its the same with
kenwood,Yaseu,Icom they all make amatuer radios that will basically do the
same thing but each has engineers that design there own version based on
what they feel will work. Some work better than others but Did any of them
invent the radio? Or its idea.

Never ever heard me say he invented the idea of a digital dash, other than

he designed his own digital dash, and the accompanying electronics

>

===
I have yet to see any improvements by #12 that have made a difference in the
comp amps. Again he offered to do the warranty work, he was not needed for
anything else.

>
> Before X-Force was on the "hit list", "Shit list" or whatever else, it was

No it was cookie, remember his were taking over the market . Noname hasnt
been a threat other than on he web boards

> Everyone has to have a bitch about something.

And your No different.

>
> The consumer bitches about DaveMade taking so long to get a product to
them.

----
ask Ice cold how long it took him to get his amp 2 or 3 days hmm some wait.
Why do you think there is a wait because nobody wants them.

>

```
> The DaveMade people bitch about people "stealing" their design.
----------------------------------------------------------------
Stealing the design, where to get the parts and names and numbers from a
customer base may not seem like much to you. But  saying it is in a motrola
book and that this is where he got it is complete bullshit.
>
> See the justice?
--------------
Not really

>
>
> So everyone should just quit bitching.  If you want a DaveMade amplifier,

----------------------------------------------------------------------------
------
Again I think Ice cold and Programbo got theres in less than 5 days from
what they have said in other posts

>

-=--------------------------------------------------------------------------
-----------------------
Toll I asked a simple question about a rumor I had heard from someone who i
feel is giving me true information and that I still stand by is true. read
it

" Is it true 123 the  is no longer affiliated with X-Force this is the
latest
news i have heard, since 123 was the main man behind x force getting there
start  he brought davemades technology, customers, suppliers etc  with him.
I am assuming he is not needed now ? "

So check the posts after that and tell me  who started the rest if people
don't like what I have to say sorry it is the truth. I am not sure where to
call him is he up north or down south?

>
>

----------------------------------------------------------------------------
-
```

No never said you did but if you came to his shop and saw his, then watched him build his, then built your own and started selling them saying dave got his idea from Autek I may then say you copied his

>
>
> I am not trying to be a dick, Dennis, I am just tired of the wasted bandwith

===
I am not trying to be a dick either it just come naturally for me, I am tired of lots of the arguements you and everyone else get into as well about lots of useless info but i don't say anything. I just want to know why is it any different for me to ask what happened to dan, should'nt the consumers know if he is no longer with them. Other than that my post were jumped on by x force 151 and warlock and i said what i felt was needed in my replys Some people dont like the truth. If the rumor I heard was true and we find out in time will I still be a dick?

Funny how I find it hard to believe how ownership went from Big Steve to a mudduck Rich.

Steve? You're doing a fine job. Maybe this copycat dealer here would definitely go out of business, huh?

Laterz...

CB1999

> QRM

------------------------>

I guess I missed the intent of the original, sorry. I wrote in the vain that 200 hz drift from cold to operating temp was hardly worth worrying about. I understand it would make the SSB impossible to understand if not corrected for. I find this small drift acceptable and never had any problem compensating for it.

Had I needed a tighter tolerance I would have designed a small heater circuit for the xtal osc.'s in the unit. This would settle the unit down quicker but it would still have that initial drift at startup unless you allowed the heaters to run with the unit off.

I might also have added a temperature compensated voltage regulator for the ref osc.'s, vco and offset control (clarifier). This would have been more work than having to turn a knob slightly every now and again.

Since the 2950,2970 and the Turbo are the same radio I would expect the same conditions from each. In fact, I would expect the same from any cb or ham radio that is subjected to the rigors of temp changes.

It isn't any problem for you to ask about dan.

The problem was the dredging of the old shit up ....

Again.

Don't know if you will still be a dick, entirely up to you.

This radio was junk. Bought it on Wed., returned it today. Lossy type receive and terrible SSB transmitting. The heat sink from the finals would heat-up after 2 min. of talking. Was not happy. Cranked down to 6 1/2 watts to drive the linear and it was good then but not by itself.

Display was off, tried 3 different freq. counters and all showed the same results(If you are wondering, the main testing unit was a $5000 HP digital-200 mhz O-scope with 1hz accurate freq. count in it).

Final word, DON'T BUY IT!!!. Mine is sitting back in the store waiting for another poor soul.

Get a HR-2510.

Jason

My, my, my... Looks like the DaveMade boys have themselves a little punk now, doesn't it?

I always thought Dennis could fight his own fights, and he always has...
Does he pay you for the shit you spew, or do you do it for free?

I prefer to think that you do it for free.... I wouldn't want to lower my opinion of Dennis.

> "Toll Free" Why do you even get involved with these messages

Because I have been around here, put up with the wasted bandwith and have to listen to Dennis bitch about how Danny "stole" the secret DaveMade recipe at least once a month.

It is like a broken record.... It got old nearly 6 months ago.

I like Dennis, always have. That doesn't mean that I have to agree with the way he handles DaveMade / X-Force battles on the public forum of rec.radio.cb.

any way I never

> heard of any product with your name on.

Then you haven't been on the west coast or the south much.

I don't do the competition shit much anymore, but you ask the bigger stations on the west coast (Skipshooter, BigBamBoo and some others), and they will know who I am.

Your insignificant. You know a couple people (and I am giving you the benifit of the doubt here... I really do believe that you know Dennis, and that is about it) that make DaveMade, and that is about it.

Great. I know the same. Now what?

I know your thinks the same about me

No, I think absolutely nothing about you. I feel that you are a pile of crap, who cannot spell, puts a bunch of lies out their and decieves others.

Yep, that about sums it up.

No, wait.... I believe that if Concrete Man told you how to blow your nose, you would listen, and do it.

> but I Am a Dave Made user and was for a very long time.I use nothing but
> Dave Made and that is why I put my two cents in what is your excuse?

Great. Loyalty is nice.

What is my excuse?....

Excuse for what? For my comments?

Because I was one of the oldest people on this newsgroup. At this time, Bill Eitner and Brass Monkey are about the only people out here longer than me. Concrete Man and I have been about the same, I believe. Therefore, I can post what I want, when I want.

So can you, even though half the time you don't know what you are talking about, have no idea of the reality of the world, and are just a stupid kid with a pocketful of change that has found a manufacturer that is more than willing to trick him out.

Yes, what you have been told will work, but not to peak efficiency, and why half step?

>
> Your site links to Dave made and you talk all this shit about them?

Yes, I do link to DaveMade. Who gives a shit.

I talk shit about DaveMade?

No, I don't think so. I talk down to people when I feel that they are
opening their mouth and inserting their foot, and more than once I have
bagged on Dennis for the way that he is handling the X-Force fiasco.

It is old news, and should be dropped. Everyone knows what is going on and
who really cares anymore? But, people shouldn't have to have dirty laundry
run across rec.radio.cb a couple times a month.

And FYI, I also did the same to Steve at ExportsRUs over the way he handled
the shit about dropping DaveMade. I was the person that got Steve and
Dennis together, and then had to watch as people acted like little kids.

I don't hold anything back. I don't care who you are, or what you do in
this industry. If I think that you are acting like an asshole, your going
to be told that your acting like an asshole. At least nobody here has to
figure out which asshole my nose is planted in... Something that was self
evident with you!

I don't
> get it every since I posted those emails you sent you totally changed the
> way you talk about concrete.

No, it totally changed the way that I felt about you. Made me realize that
you don't have the education that you think you do... At least, you don't
have the emotional side of it down.

You remind me of the little tweaker who packs his nose, then goes on a shit
rampage.

And true to what I say, about the same time every week, you go hell bent on
the newsgroup with more shit.

Gee... Put two and two together and see what you get.

I care less what you, Dennis, Danny or anyone else thinks. If they can't
see that someone who speaks their mind, TRUTHFULLY, is someone to listen to,
then so be it. However, I don't think that Dennis and I have any
irreconcilable differences.

When Dennis has a problem with something I say, he is more than welcome to
call, come by, email or whatever me and we can talk about it then. So far,
this has yet to happen, which leads me to believe that Dennis is more mature
than you, and can have a disagreement with someone and then let it go..

You have been unable to do that, junior.

> I'm sure he doesn't give a flying fuck about me and I don't care as long
as
> he gets me my amps his is #1 in my book.

No, your attitude speaks different.

> I don't know why every one complains about delaying

Because it speaks of a couple things..

1. People want to have correspondence with the people they deal with.
2. People want to know that after the sale, the manufacturer will be their to back the product up. When it takes months to get the product, you have to question the after sales support.
3. DaveMade has been plagued with the same problems for quite some time. You would think that the manufacturer would get better distribution channels, better or more builders and would be able to deliver a product in a timely manner.

Yes, everyone can see that their are times when a manufacturer gets behind..... But, they either hire more people, or get their ass in gear and make up for it.

They DON'T let the problem continue to manifest itself until it becomes public knowledge.

how many of these people
> send payment in advance?

Pass?

You know Dave Made isn't dealing apples were
> talking illegal shit here

Yes, and since the 80s, I have been dealing with the people that deal it.

Messenger? Lived about 20 minutes from the person who built and designed it.
Texas Star? LIved about 45 minutes away
Palomar? Lived a bit farther away

Now,

Silver Streak
Blue Face
Magnum
Messenger
Texas Star
Cookie
X-Force

They don't seem to have the same problems with delivering product, and they all ship more than DaveMade does.

What does this tell you?

That they don't have the inner turmoil, they have more people building, they have better distribution, etc., etc., etc. than DaveMade.... Singly or a combination of the above.

and When you get a hundred idiots a day saying
> they want to buy an amp and change there mind you also will start blowing
> off people.

Bullshit.

Only an idiot would think that way.

I have no problem sending money in advance and I have no problem
> getting my amp.

And you also live an hour away.

Gee... Funny how that works, isn't it.

And you are also purchasing a large amplifier, that automatically has more profit built into it.

See the big picture yet, Jr.

>
> Why don't you go start a Texas star thread of your own and keep you.

And keep you what?

I have you frazzled again, I can tell. Your not even finishing your sentences again!

I doubt
> you will get many people to join you but why don't you give it a try.

Been their, done that.

Besides, what purpose would it serve. Texas Star has been around longer than most of the amps on the market today, have a proven design that works for the targeted audience, and don't seem to have the "dirty laundry" that your boys have.

As a matter of fact, the only time people bitched about not getting a Texas Star was when they where busted!

That seems like a pretty good track record to me.

A. Good delivery.
B. Good product (for daily driver amps).
C. Good customer service (great, if you ask me... Way over and above the call of duty)

Or, to say the same thing that you do... This is a public forum. I can post where I want, when I want, and their is nothing that you can say that will make it any different.

Why shouldn't I be allowed to say what I want, when I want. You say that you can!

>
> Every Dave I get many emails about people making fun of you and your
> stories. It makes me laugh.

Every Dave?

I don't get it.

Did you mean Every Day?

And, sonny boy, I can say the same about you, however, to leave the dirty laundry where it belongs, I don't say anything about it.

The emails don't make me laugh... You do that enough on your own.

> I will be the first to admit that I am nothing in this CB game.

You got that right.

 I know I'm
> just a sucker with money but You are not one bit better but you act like
you
> are the coolest thing since sliced bread as Denise put it and I find it
> true.

Who is Denise?

Are you making fun of your boy now?

>
> Get a life and stay out of the Dave made conversations if you don't like
> reading them!!!!!!

No. I can post what I want, when I want, where I want.

You said it first. Can you blame someone for following your lead.

If you don't like what I have to say.... Don't read it.

Use the kill file.

Lastly, get off of people jockstrap.

You are a fool, you have a pocketfull of money, and it shows.

Peace I'm back out!!!!

If only that was true.

Sorry. I didn't mean to confuse you with the big words.

I really do apologize.

> I pay $40.00 a month so I don't have to worry what my the BGP4 routing
> protocol is,

What my the...

What does that mean?

and how to implement redundancy through it, and how to keep a

> firewall system running utilizing BGP4 and multiple internet routers?

Why not... Your the one with the big education here.

Or.... Wait... I forgot. It is just nice to talk big, but not be able to back up what you say.

I assumed that your education must have been in computers, because you really don't know shit about electronics.

That was proven a couple weeks ago with the crap that you attempted to sell the newsgroup about volting an amplifier!

>
> This is the same way I dont worry about how amps are built or anything you
> think you know more then me about.

Think?

No, I have proven it.

> When I want somthing I get it. If it cost me money I dont care But I get.
> I have betterthings to do then lean big words and try to impress people on
> news groups.

So do I.

Unfortunately for you... I like to piss you off.

Your easy. Hell, you can't even spell or use correct linguistics.

Robert Joshua Chen wrote:

> 1. Can the beep that accompanies the pressing of the buttons be tunred off?

Yes. Cut or unsolder one of the wires going to the beeper.

> 2. The sensitivity seems good, but the S/N and NL are a bit weak. Any way to improve these via mods or in-line noise choppers and such?

There are mods floating around, but it's debateable whether they're worth the effort. I did some receiver mods in mine, and I did a meticulous alignment; the result is an improvement of about 15%. The basic receiver design is poor; they used bipolar transistors where they should have used FETs, and the filtering isn't very good. To see any real improvement would require a redesign--not simple mods. An old ham technique that helps a little with that radio is to lower the RF gain as much as possible (depending on the strength of the incoming signal) and compensate for the decrease in receiver audio by increasing the volume control.

> 3. How can the AM mod limiter be disabled while leaving the SSB AMC intact? According to the tech who worked on my radio, this is what he did, but I just want to know exactly how he did it...

More than likely he simply adjusted VR14 rather than removing TR32. VR14 controls the AM AMC, and VR16 controls the SSB ALC. In the 2950 there's no gain in AM modulation by removing TR32. In other words, adjusting VR14 for maximum AM moduulation is just as effective and it doesn't effect the SSB ALC.

> 4. Finally, what kind of power output should I be seeing in a peaked
> radio? Currently, I have 2-10 watt deadkey on AM swinging to about 35 max.
> SSB varies from 15-25. I'm wondering if I should tweak this further...

35 peak watts on AM is good for a 2950. I typically don't see that much, but I'm sure there are differences in our test set-ups that account for it. If you're curious, you can put the radio on Channel 19A and make sure L34 is adjusted for maximum peak (modulated) output. L34 has the biggest effect. You really don't need to go any farther, but if you're just overcome with curiosity you can also peak L19, L48, L47, L46, L43, and VC3, but you probably won't gain much. If you're not going to run an amp, you can crank up the driver bias (VR11). You can also increase the coupling capacitance from the pre-driver to the driver and from the driver to the two final transistors. To do so, increase the value of, or add additional capacitors (up to 330 pF) to, C270 (pre-driver to driver), C261 and C262 (driver to finals).

That about rounds out the typical tune-up mods that are done to 2950s. There are more radical transmitter mods and a host of other mods that can be done to the 2950, but the typical tech either doesn't know about them or won't include them in a simple, low-cost tune-up.

Greetings!

And why they're called pills, is due to the long hours those back room
techs put in each day...

Sometimes they can be mistaken for BUFFERIN...;->

While Dancing with the Mouse on Fri, 26 Nov 1999 17:52:11 GMT, the
Modem interrupted with an MNI from ""prozac 625"
<prozac625@bayshorenetwork.com>", and the MotherBoard buffered this to
Video RAM:

:+> The term Pill is used for the transistors used in CB amps. Such as the 2290
:+> & the 2879 transistors by Toshiba. And also some MRF and other types. They
:+> look like a big white pills.
:+> A 16 pill = 16 2879's, A 5 pill = 1 2290 & 4 2879's

BUFFERIN=Releives Operator Headaches caused by small BUFFERS...

Regards!
:+> Andy <+:

The term "pill" is a silly CBer word for RF Power Transistor. Nowhere else is the term used. I don't know where it originated, but I don't like......I don't like it at all.

Yes, the signal does bounce of one or another of the ionization layers in the atmosphere. But the bit about a "less dense pocket of O3) is bogus.

It is unlikely that there are multiple bounces in the ionosphere before returning to the Earth, but it "could" happen. The usual path for any multiple bounce skip is: transmitter to ionosphere to Earth to ionosphere to Earth ... to receiver.

It isn't necessary. I trust you will agree that the transmitter in not seeing the designed 50 ohm impedance at the input to the coax. In other words, it is not operating into the designed load.

But the input power to the finals is the same as with a perfect match. The input cannot see the mismatch on the output. The result is that, due to operating into a mismatched load, the finals operate at lower than designed efficiency. This means that there is less power out of the finals - with more of the input power being converted to heat in the transistors/tubes.

Collins rigs are probably not the cleanest rigs around.  They were all made
a long time ago, and circuitry design has progressed since then.

I would expect any recent, properly aligned rig to be better.

>years. I have an older 2950 that, once I put it on freq., has stayed
>with almost no trouble.

The original poster was referring to a very TIGHT frequency tolerance.

>  The temperature changes only caused me to shift the clarifier
>ever so slightly from center during temp changes.(Cab warming or
>otherwise)

Your radio appears to exhibit the same characteristics. The original poster
referred to 200 Hz.  You are describing something very similiar.

I have two 2950s and one 2970. Also had the Saturn Turbo.  They all drift(ed)
with temperature.

Toll,
I was the fellow that threw the M2057 into the equation.
8950's were a good tube BUT the M2057 was better.
Wished I had a truckload.
It would be me making the clay pots and hitting on the chick
in the commercial instead of Donald Trump. 73 op Donnie N4JZH

I never said anything about computers but You put allot of words in my mouth
so I wont bother to go there.
I pay $40.00 a month so I don't have to worry what my the BGP4 routing
protocol is, and how to implement redundancy through it, and how to keep a
firewall system running utilizing BGP4 and multiple internet routers?

This is the same way I dont worry about how amps are built or anything you
think you know more then me about.
When I want somthing I get it. If it cost me money I dont care But I get.
I have betterthings to do then lean big words and try to impress people on
news groups.

"Toll Free" Why do you even get involved with these messages any way I never heard of any product with your name on. I know your thinks the same about me but I Am a Dave Made user and was for a very long time.I use nothing but Dave Made and that is why I put my two cents in what is your excuse?

Your site links to Dave made and you talk all this shit about them? I don't

get it every since I posted those emails you sent you totally changed the way you talk about concrete.
I'm sure he doesn't give a flying fuck about me and I don't care as long as he gets me my amps his is #1 in my book.
I don't know why every one complains about delaying how many of these people send payment in advance? You know Dave Made isn't dealing apples were talking illegal shit here and When you get a hundred idiots a day saying they want to buy an amp and change there mind you also will start blowing off people. I have no problem sending money in advance and I have no problem getting my amp.

Why don't you go start a Texas star thread of your own and keep you. I doubt you will get many people to join you but why don't you give it a try.

Every Dave I get many emails about people making fun of you and your stories. It makes me laugh.
I will be the first to admit that I am nothing in this CB game. I know I'm just a sucker with money but You are not one bit better but you act like you are the coolest thing since sliced bread as Denise put it and I find it true.

Get a life and stay out of the Dave made conversations if you don't like reading them!!!!!! Peace I'm back out!!!!

Greetings!

What was being described, and what is pertinent to the radios own are two different things.

Input *to* the finals.
Output *to* the antenna.

Unfortunately the impedance present on the network *to* the finals is different due to the mismatched load. This we can agree on.

To have "Reflections" claim "Automatic" deserves some clarity.

Automatic as in the Unbalanced Output of the network, and the "Impedance the radio sees from the load". Which one is which?

One deals with the network.

The other deals with what goes out the radio, and into the load.

To simply state "Automatic" is not really answering questions regarding the load, and how the radio reduces power.

The output of the radio and the input to the load is simple, it's "automatic". Impedances are not equal.

But to say the "radio reduces power automatically" - thats my axe to grind.

Remeber what he says about Z2 and the Dummy load. You now have two types of matching impedance - one pure resistive, the other reactive.

It was phrased as "You can lose power".

So, Why in H*ll write the d*mn book in the first place?

What has it accomplished?

1. Only that a Dummy load shows resistive.

2. You can use coax to conjugate an antenna at a different R+/-jX using the opposite +/-jX the coax can present for conjugate match for SWR control. Can't solve for R, which was said before, but at least you can get the SWR down.

3. That if your Source impedance and load impedance aren't correct you lose power "Automatically" as far as the radio is concerned.

Because of the radios Network sensing a different impedance, than that of the antenna system, reflected power is not considered a loss.

Very good! Now, what about that source impedance versus antenna system impedance? Brings us right back to number one.

Only thing? Reflected power is not considered a loss, at least not yet. But "the radio reduces power automatically".

I wonder why?

Which brings us right back to number 1.

Basic common sense.

And people flame the h*ll out of others for "trimming" coax.

H*ll, flame them for not running the right antenna to do the job!

Or, for grins and giggles, send them a copy of Reflections!

[Sorry folks, I have my copy...;-]

It's not going to make the problem go away. People are going to do what they want.

This is why it's more important to say "You have to settle for what you get." Than to inflame a riot over "Don't cut coax!"

It's bad enough when people don't understand the LOCATION is one of the many keys to solving the inflammable answering of "trim coax".

Maxwell, for all his effort, is saying IMI - "Arriving to a conjugate match to arrive to the output impedance of the radio, the radio then can load it's full power into this type of matching system. The antenna attempts to radiate this power, and some currents on the outer shield do occur but multiple reflection and forward power, their *incident* power remains the same as the radios output power into this type of load. As if this mis-match never occurred."

Nobody ever spoke up for the Manufacturer.

[Don't tell me they're the ones that started all of this!]

Did anyone read the last chapter? He raises all those questions and concerns again - and summarizes it all as to "Transmitter can be damaged if your radio and antenna impedances are different".

Bandwidth of the Tank coil circuit for the final is what determines the radios ability to survive a mis-match. It [coil] and final have to exceed the impedance changes the load will present - this presents the *actual* SWR Mis-match the radio can safely handle.

Sorry, folks, the Dummy load has it's place, but the real world is a completely different universe.

So what happens to all this reflected power? Well, you increase the bandwidth the *incident* power creates. Nothing is lost, only converted, or conserved - with marginal losses in heat and resistance.

This is a pure test of the conjugate match - when the bandwidth of the matching system, can exceed, and provide control of, SWR before the increased bandwidth caused by "incident" power changes the networks impedance response to the finals tank coil circuit and ruins the finals.

Brilliant!

Can we all get on with our lives now?

While Dancing with the Mouse on 27 Nov 1999 02:12:33 GMT, the Modem interrupted with an MNI from "billn@peak.org (Bill Nelson)", and the MotherBoard buffered this to Video RAM:

Greetings!

There is a TX freq adjust in those things.

When broadbanded, the RCI shouldn't exhibit any real change in frequency.

If it is, re-check the work. Sounds like a loading [voltage or current leak into the RX/TX bias for PLL reference] problem.

Check voltage!

When the radio keys up, the voltage should not drop. They're regulated to within 1/100th of a volt - less than 5 Hz if any change is noted.

If you're dropping 200Hz, I'm wondering if this is consistent. e.g - Both RX and TX are off 200Hz or just one portion?

To check that, requires you to look at the two reference IF's. That is a realm of the RCI I haven't been into yet.

You just have to locate the one that drops [let's see 10.240 and 16.XXX for Uniden style - I'd look at both, especially Audio IF - ones I've come across that "bail out", are usually due to loading of loud/heavy audio into the Xtal filter/mixer and can cause voltage to drop out. Disclaimer: These are from Uniden notes, not RCI.]

You may also have a problem with "tracking" the external freq counter does to the signal. Trying to travk audio from SSB radio full blast, you don't get a very steady reading - an external radio "Audio Check" with a remote base radio and an honest operator would work better.

Check Carrier Balance, no carrier power should be emitted. The carrier
can also cause the shift you see in the freq counter.

While Dancing with the Mouse on 25 Nov 1999 09:37:13 GMT, the Modem
interrupted with an MNI from "rjchen@leland.Stanford.EDU (Robert
Joshua Chen)", and the MotherBoard buffered this to Video RAM:

:+> Just got an RCI 2950 modded for 26-32. I noticed that its freq display is
:+> off by 200 Hz. The radio transmits 200 Hz below what it reads on the
:+> display, according to an external freq counter. I'm wondering if this is
:+> normal for this radio or is it indicative of a bigger problem (alignment,
:+> etc) that may need looking into?
:+>
:+> Thanks,
:+> -RC

Regards!

>This is because your radio is drawing current and the resistance of your
>power
>leads is actually dropping the voltage a little when you transmit.

this actually dropping the voltage quite a bit as the radio companies don't spend anymore on things like wire than they have to.
theoretically speaking, assuming the radio actually swings 50 watts, it is drawing 12 times more power on the so-called 50 watt peaks than the supplied power wire was originally meant to supply for the original 4 watts out. if the power level drops below the internal voltage regulators lower threshold, he could actually be frequency modulating his signal if the voltages vary by a large enough ratio at the PLL as to affect the loop filter, lock detector or the VCO.
heavier wire from the board out would be in order if this were the case.

>> Also my SWR is a little higher now, is that also because of the new finals.
>>
>
>The VSWR should not be affected by the output power. It is a relative
>reading.

>Basically, your
>mechanic has bastardized the radio such that it will over-modulate like
>crazy.

>much of your
>signal's energy is wasted in harmonics that won't be heard by anyone.

you've answered your own question here.
the mechanic has probably fiddled with TVI filtering or has over run it with the extra power levels installed.
if he's transmitting harmonics, this WILL show up in an SWR meter as they're very broadbanded and are not frequency selective.
his antenna may be 1.1:1 at 27.XXX mhz but it will be substantally higher as he starts transmitting 2nd and 3rd harmonics past it's filtering, that the antenna is not matched to.

>It could be that the extra power is making your VSWR meter read more
>accurately
>as it is working with higher voltages now.

>
>> The person who installed the finals said I had 7.5watts swinging to 50,

he didn't say whether he was watching his SWR meter during modulation or not.
if this is the case, when he sets his SWR meter in the cal. mode at 7.5 watts,
when that 50 watt swing hits it in the ref. mode, his caliberation just went
out the window and the needle will swing higher for sure. it will look more
like a modulation meter because it is trying to read a peak power level almost
7 times higher than it was originally set for.
to get an accurate reading under these conditions, assuming he's not throwing
harmonics, he would have to inject a tone into the microphone that would give
him maximum swing while setting his calibration. then he could see what his
actual SWR would be under max. power conditions.
jeff

>Was wondering if it was illegal or not to inform people of radar traps and
>what not..

i don't know for sure but my guess is that it would vary from state to state.
it may be viewed as interfering with law enforcement but i would ask AAA.
they would be able to tell you.
they know all of the speed traps and tricks.

>Also I plan on getting an amp for my cb.
>Was wondering if say I was to get pulled over and the BEAR seen the amp if I
>would get a ticket or something for it?

not yet but there's a bill in congress now that might make it possible.
call your congressman and tell him to vote NO as it's the FCC's job and not
some un-trained persons job.
larger metropolitan areas may have hams or trained personell on the force who
can tell the difference between an illegal 11 meter amp and a legal 2 meter amp
but in smaller localities, they may not have the budget to properly train
someone and the law won't be properly applied in every case.
good luck.
jeff

Not Everybody runs that low ah power for a driver, get a hold of yourself man.

Gee Whiz, if you complain about such insignificant things, I wonder what the Big Ten-4 things do to ya Joe? And again you offer no real help. I use to like to read your posts, RH2, but you whine way to much. Sure sounds like a liberal Democrat.

Hello Clear Inc.: The channel guard will help, but the all round best thing is a beam antenna that you can turn the beams side null to the other stations direction, reducing his signal or interference, by a whopping 30 to 40 dB! The bigger the beam the more side null you will have, if the beam is installed away from near by objects.

Jay at jay123a@qnet.com .... In the Great Mojave Desert, just down the road ah ways from the fillin station. Miss Dinah (says:) "Winters ah coming U Desert Rats".... the fillin station has the good heavy duty Tarps to cover your tractor. I bought two, one fer the still, and one fer the tractor.

There is the strong possibility that you have a "view" applied to your newsreader. If so and the newsreader is set to "hide read messages" then once you read the message it will not show up again on your screen. The message is still on the NG but you're not gonna' see it. You would need to go into your newsreader and tell it to "show all messages".

I have a Radio Shack TRC-225 handheld forsale. 40 channels. Looks brand new! Comes with rubber ducky antenna. Power switch (HI and LOW). Comes with strap to put in your hands. Also the channel selector is on the side so you don't have to reach to the top to change channel. (You can use your thumb for this!).

Make an offer over $20.

If you were tuned to the right frequency you would've heard me too. Was talking to Bucks, Lancs, Kent and E. Sussex. That's talking - not shouting. :->

How do you figure out exactly what frequency a radio is receiving on compared to what the freq display is showing (for an RCI 2950 in particular)?

Thanks,

Excellent question, Robert--one that should be asked more often.

If the signal is AM or CW, you can set your receiver to the CW mode and tune for "zero beat". Then read your dial/readout.

If the signal is AM or SSB, you can set your receiver to USB and tune until the voice sounds "natural". Yes, that's right--it works for AM also. When the voice sounds normal, read the dial/readout.

All of this assumes, of course, that the dial/readout is calibrated against a standard. For most of us, reading a signal to the nearest 1KHz is adequate.

By the way, using the USB mode on a weak AM signal often will work wonders.

Your second source is wrong also. Maybe you should take what you hear with a
grain of salt.

>> I like standing up for people who try hard, provide customer service in a
world where it is rare anymore, build a quality product in a timely manner and
stand
>> behind it.
>------------------------------------------------------------------------------
>-------------------
>How do you know davemade doesnt try hard, build a quality product, and stand
>behind it. Have you ever dealt with them personally? Have you ever bought
>anything from them. ?  Are you going on second hand info?

If they're trying hard, then they define "hard" differently than years ago.
Yes, I have used and sold Dave products. Since X-force came about, I no longer
have to wait for repliesand wait for products. Unlike you, I don't repeat
rumor, I deal with first hand information.

>>Ask some of the guys in here who have bought from them How they rate? Not
someone who hasnt had any dealings with them.<<

I can see that people who live close to a distributor haven't had problems that
they will admit. That's great, but what about the rest of the country?

>If that makes me an X-Force cheerleader, then so be it. If that's what I am, I
```

think I'm a lot better team representative than your

The 8950 is a 12 volt version of the 6KD6, according to the RCA tube manual. It stated, Other than the filament rating, the internal structure is identical. I sold a lot of 6KD6's for conversions at hamfests, and had hams bugging me for more, for several years.

Here's what I want to do,

I have restrictive covenants in my neighborhood (no way to move out either, don't ask.) so I can't really put up anything big like an A-99 on the chimney and climbing one of the trees would be somewhat hard so I am wondering if I can mount a 108 inch whip on the top metal part of my chimney. If so, would the SWR match well and what should I do about heat, we are using a gas log fireplace if that helps. Is this possible? Thanks!!!!!

As a side note, I was walking near the Capitol building yesturday (l live near DC) and someone once had one mounted on a exhaust pipe. The thing was old, the mount was rusty. Could this have been CB, it looked like a 108 whip or could it have been for some other band? Oh well, thats it, thanks!

In one block, it doesn't matter if it's 4 watts or 400 watts. You
are going to hear your neighbor. You're bleeding on his radio, too.
There are a few spots in town where there are 3 or 4 stations within
a half mile. They stay on the same channel the others are on because
they can't hear any other channels when the others are talking.

I have met a lot of nice folks due to bleedover. I just join 'em as
they are passing thru. Sometimes I'm just passing thru.

Try to get along with your neighbor. It works wonders.

Just curious how many Pennsylvania DXer's are on the board....... Or in
around the Keystone.

For the FCC inclined, since DXing is technically not allowed, I will clarify
that MY personal opinion of DXing is talking no more than 2 miles away....

MC,

How you doing?
>If you were tuned to the right frequency you would've heard me too. Was
>talking to Bucks, Lancs, Kent and E. Sussex. That's talking - not
>shouting. :->
I bet you that was on side-band!

That's not talking, that's taking the easy route:-))

There are few, if any UK stations with the capabilities to cross the
pond on AM. I hope to change that.

I used to live in Buckinghamshire, I'm now based in SW London in the
county of Surrey.

I wanted to get a Cherokee AH-100 for Christmas, but it seems as though
that model has been either discontinued or no one stocks them anymore. Was
there a problem with the AH-100 model?

Also, is the Spitfire a comparable/better unit than the AH-100?

I'm not interested in being able to tweak power on a handheld, just that I
am able to connect an external antennae and have access to LSB and USB in a
handheld unit.

Thanks,
Ken

Hello RH2: I sure get a kick out of your responses, but pretty
predicable. In the sense of predicable, your response is of no technical
help, or technically incorrect, and snotty. You got all three, way to
go.
Where ya all trained to act like this, or where ya brought up this way?
You sure appear to be spring loaded to snotty and technically incorrect.
A lot of hams are.

I went to the TRW swap meet (Near the Los Angles Int. Airport)
yesterday, and over heard a couple of elderly hams talking. They where
sure discussed about the way the ham radio fraternity has turned out and
all. They remember when most all the hams where friendly, and this made
the hobby very attractive for new comers. Boy did they bad mouth guys
like you Joe.

There's a few snotty and technically incorrect guys like you who show up
at the local coffee shop. I make sure I set next to them, and correct
all the wrong things they say. And the snotty part, no problem, I
offered one guy $20 dollars if he could act like a real human being for
just ten minuites, no takers! But he did tone it down a few dB.

Jay at jay123a@qnet.com .... In the Great Mojave Desert, just down the
road ah ways from the fillin station. Miss Dinah at the fillin station
yells: "You SOB's whip your feet before enterin my gas station, and
iffins U pick up stuff with them dirty greasy hands you bought it,
Buster. Wash room outs back" U sure don't get service like this at one
of them fancy "Gas & Go's fillin stations, on the main drag.

Should work fine for you. This type of antenna expects a ground plane, so make sure that you provide one if you can. A good idea would be to use copper wire (whatever you can find, it doesn't matter - transformer wire would work) and arrange it arround the antenna in a radial pattern. Use as many as you can, the more the better, ultimately connecting them to the antenna mount where it would normally attach to the car (electrically, connected to the shield of the coax). One benefit of this installation is that if your roof slopes downward, you'll have a relatively low(er) takeoff angle, giving your signal better range, possibly even slightly directional toward the direction of the roof's slope.

Heat should not be a problem,

The funniest thing is that whoever wrote this probably believes it..A Wilson 1000 is almost 2/3 the price of a Dave coil and is far from even equal...Oh well....Let them stay a mud duck and the rest of us can walk all over him

I hope I did`nt brain my damage.

I listed this amp once before and although there was a lot of interest, no one bought the amp. So, here it is again. I have an SB-200 amp in excellent condition with full output of 600-700 watts all bands except 10 meters. It does 350-450 watts on 10. Also tunes the WARC bands at reduced power. Has Harbach "Soft-Key" mod already installed, so the amp can be keyed with any solid state rig.

I would like have $340 for the amp and will split shipping cost. I will also consider a trade for an hf rig I can use as a mobile, since thats one of the reasons for the sale. Would prefer a Kenwood TS130, 180 or 140S in like condition.

If your interested, email to rpemers@aol.com and we can talk.

No. A noise-cancelling, power mic is a contradiction in terms. Either you want a power (amplified) mic or a noise-cancelling mic. Beyond that they simply sound bad. In an attempt to cancel noise, the designer decided to roll off the mid-high end frequencies--which makes you sound bassy with no punch. That's exactly the opposite of what you want.

> Looking
> maybe to get for my Cobra 29WXNWST.

Good noise-cancelling mics include the Turner RK56, and the Astatic 636L. If you just have to have an amplifier in the mic (you don't need it if the radio is tuned up--29s have plenty of internal mic audio amplification), the Astatic Road Devil is a decent choice as long as you don't get carried away with the volume control and negate its ability to cancel noise.

> Thank you!

You're welcome... I hope this helps.

One thing that was left out in the replies to this garbage post.....Steve is here in Memphis this weekend and i know he didn't bring a puter woth him. Something tells me that if he where to be closing down he would have said something about it while my wife and I were having dinner with him and X-Force. This is the second post I have noticed from some douche bag from a blind posting site.....The headers don't lie and always tell the true story!

Ok I will try again.I have enough parts from an old moonraker to assemble a 4 element horizontal.I would like to use a straight horizontal element for the reflector,maybe 18 1/2 feet?? I do not know any other measurements,element lengths, spacing, etc.Any ideas on these and tuning would be greatly appreciated.

Thanks

The reason I say I would try again; is because, I posted the same message on the message board yesterday, and now it is no longer on here.

did I do something wrong or is there something else I need to do to keep the message on the board longer?

Thanks again

There are now four different radios using the same (or similar cases):

1) Radio Shack TRC-485 - Discontinued in 1999
11 meter SSB (not set up for out of band operation)

Yellow colored display
Through hole main PCB

2) Eagle SideWinder 400 from Copper - Still available
10 meter SSB (convertible)
Yellow colored display
Surface mount main PCB
Better built than the TRC-485

3) Radio Shack HTX-10
10 meter SSB (convertible status unknown)
White colored display
(I have not personally had one open)

4) JCRE 485
10 meter SSB (claimed to be convertible)
White colored display (identical to HTX-10)
(I have never seen one in person)

Help Please?

I have posted twice now a message, for help on an antenna,,, but it doesn't
seem to stay on the board? So here I go again....

I have enough parts from an old Moonraker 4 to assemble a 4 element horizontal.
I would like to use a straight horizontal reflector element, 18 1/2 ft. maybe?
I need ideas on element lengths and spacing. I have no original information on
the Moonraker assembly measurements. The driven element now measures 17 1/2 ft.
I have no idea if this is the correct measurement or not. I don't know what the
director measurements are supposed to be or what the spacing is supposed to be
either. Also, I need suggestions on the tuning process.

Any help and suggestions on the antenna project and problems with the message
board would be greatly appreciated.

Thanks for any replys

wait.

```
> Why do you think there is a wait because nobody wants them.

COME ON CONCRETE, EVERYONE ON THIS NEWSGROUP KNOWS THAT ICECOLD IN NYC
HAS A VERY GOOD AND LONG RELATIONSHIP WITH DAVE AND PRIME MINISTER.
THAT IS WHY HE CAN GET HIS STUFF SO QUICKLY. I AM SAVING UP SOME MONEY
AND I WILL GET A DAVEMADE SOON. BECAUSE I AM QUITE SICK AND TIRED OF
HEARING ICECOLD IN NY GET HIS NAME CALLED ALL THE DAMN TIME.
NO OFFENSE COLD, YOU JUST DRIVE ME CRAZY OUT THERE ON THE SUPERBOWL.

These were facts that I stated, NOT OPINIONS. Read alittle before you
post. The heat problem, freq offset, noisy receive and transmit, yea,
sure, those were just opinions. I guess you buy all this expensive
equipment just to have an opinion.

DUH

Funny how my freq counter shows 28.507 but the HTX shows 28.500. But I
guess that's an opinions too. Not a fact. Funny how my HR-2510 show
28.500 or 501.... Maybe the 2510 is a piece of crap!!!!! and not the
HTX.

What's YOUR opinion Chris???

i seem to see a patern developing here. in each and every post he mentions that he has money. well i wouldnt doubt it at all if hes a broke little kid. often the ones bragging about what they have dont even really have it at all. were all on the net with computers and we all have CB's so its a good guess not too many of us here are broke people. go some where else with that bullshit. while our sitting in your car talking on your 32 pill, i'm sitting in my brand new house on the water talking on my base or typing on my new computer. who cares?

jeff,

also look at speedtrap.com, they have lots of little tidbits. I don't know of any state having such a law banning "bear reports" but then the AAA might be a useful source.

As far as AMPS bringing attention, I would recomend keeping such stuff out of sight and thus out of mind. Alabama and Louisiana State Police have been clued in as to what an AMP is, so I would not be opening up my dave made right next to a patrol car. I was stopped in Alabama after the BEAR saw all my antennas and inquired. I just showed him a copy of my ham ticket and he clued me in on what was happening. It seemed that someone was running enough power to cause electronic modules on cars to mess up and it had caused a wreck. When I asked about the "propriety" of a State LEO enforcing FCC Law, I got a quick lesson-it seems that a LEO is a LEO, so if he observes Federal Law being "breached" then he may act (Bank robbing is Federal Crime, but Barney Fife would like to catch him anyway;-)(I should have remembered this from my LEO days on Sheriff's office) (I took an oath to defend and protect the United States, The State of Louisiana and the Parish of Lafourche) so it boils down to what mr bear wants to do? To continue the story, they call the FCC via their dispatcher to see what is to be done. They usually confiscate the AMP and turn it over to the FCC (who either destroys it or recycles it?) Now for the unsaid part, I don't think I would want to be a smart aleck on the side of I59/20 with the LEO since Alabama jails are not known for thier hospitality, so a word of caution. Keep it outasight-outtamind.

Wow arent you lucky .

> I answered that a week ago. Your sources are wrong.
===============================================
Thats funny a second "source" has told me almost the exact same as the
first, and they are in different parts of he country.

>

----------------------------------------------------------------------------
-------------------
How do you know davemade doesnt try hard, build a quality product, and stand
behind it. Have you ever dealt with them personally? Have you ever bought
anything from them. ?  Are you going on second hand info? Ask some of the
guys in here who have bought from them How they rate? Not someone who hasnt
had any dealings with them.

If that makes me an X-Force cheerleader, then so be it. If that's
> what I am, I think I'm a lot better team representative than your
"prozac".
----------------------------------------------------------------------------
-----------
What makes you any better than him? He loves his davemade amps, and is
willing to brag about them even if he had to wait. His only affilitation
with them is that he likes there product. I doesnt make him a bad guy.

Toll, Prozac has his own mind I havent told him to say anything. but i do want to remain friends with you and some of the others, most of this shit is really silly stuff. So I am going to be 10-7 regarding this matter unless I see something that burns my shorts and I'll have to pull the sock out of my mouth and fire away. Otherwise it is non- sense We are supposed to be making friends and helping one an other. But I do appreciate prozacs loyalty.

The radio line, TRC-485, Sidewinder 400, Prostar 400, Blackhawk 400,
etc. has always hot. I've had a TRC-485 for 4 years now and have NEVER
had a problem with it!!! I also have 2 Eagle Sidewinder 400 with NO
PROBLEMS!!!
The frequency readout is only a reference.
And lastly, $140 for an entry level HTX-10 10 meter rig with a lot of
features is a good price!!! Your actually the first person to slander
the HTX-10. By the way, If you didn't like the radio you should have
taken it back BEFORE you screwed around inside. Now some good decent
REAL AMATEUR radio operator, you know, one with a LICENSE is going to
get the one you FUCKED with and SCREWED up for Christmas, WAY TO GO
ASSHOLE!!!!!

First of all chris, TAKE A CHILL PILL. Why are you so obnoxious and rude. Apparently, you know very little about HAM technology. Let's try this...

1. USE YOUR REAL CALL SIGN. K5DC??? I don't think so. If it's true, then you are.

CARL D. CANNON
306 N AVE D
SPRINGTOWN TX 76082,USA

OK CHRIS???

2. These radios that you mention are not even the same electronics inside. They may be similar, but not the same manufacture. The Sidewinder400 is a DIFFERENT radio. Anybody else who wants to challenge me on this?? I suggest you take a look at the CPU #'s and then go look up the table (HEX CODES) for each one and THEN look at the differences. DUH

3. $140 is a good price. WHY DO YOU THINK I BOUGHT ONE???, but the features are just ok. They are plain jane and are on just about every 10 meter rig out there. And also, I'm not the only one to slander the HTX-10, try hanging out on the ham newsgroups and IRC groups. You go on there talking about your hip HTX-10 and you'll be the laughing stock of the group.

4. Besides cranking down the power and then raising it back up(again, I have test equipment that's worth more then your car.) the unit was putting out the SAME amount of power as when I got it. What do you use Chris (or I mean Carl) an analog meter that swings and peaks for measuring?? When was the last time you had it calibrated on 10 meters????

5. The REAL AMATEUR who gets this unit will only be able to talk to his other friends out there for about 2 min. before the finals go into thermal shut-down and then wait for them to cool so he can talk for another 2 min. BUT wait, that's after all his friends tell him that he's OFF FREQ by allot and has to use a freq counter just to tune in the right one SINCE THE RADIO IS GIVING HIM FALSE FREQ READOUTS CAUSE IT'S A MAJOR PIECE OR CRAP.

6. "WAY TO GO ASSHOLE"??? Nice one Chris (damn, I mean Carl), just shows the wonderful person you've grown up to be. But that's only my opinion.

7. Web-TV????? "Chris thinks that WebTV and Radio Shack are da' bomb baby!" YOU MEAN CARL!!!! RIGHT K5DC???

I just got a new Palomar 225 blue face. I turned down the AM dead key to
2 watts. The radio still peaks at 15 watts AM and SSB peaks are at 25.
Will the high PEP damage the amp after awhile? Thanks.

Why did you not simply ask for an exchange radio? Lemons happen sometime. Or did it become, by chance, a lemon after you tried - and failed - to modify it for CB use. What is lossy type receive? With funky terminolgy like that, are you even qualified to use your "$5000 HP digital-200 mhz O-scope with 1 hz accurate freq. count in it" test gear? Of course the heatsink got hot. That is what they are designed to do.

Was not looking to start a big thing with my post
asking for Opinions about Davemade Products.
In fact, I have used many amps from production line amps to X-Force, No
Name, and Davemade. My X-Force and No Name are gone and I will only use
Davemade Amps..Dennis has always been fair with me and the amps that I
have purchased were as stated on the web page..Never had to wait a long
time to receive the product, and I have been the recipient of many
compliments using the Davemade line. If I offended anyone by my post, I
am sorry..It was not intended for that purpose.The Kaptain

>guess that's an opinions too. Not a fact. Funny how my HR-2510 show
>28.500 or 501.... Maybe the 2510 is a piece of crap!!!!! and not the
>HTX.

according to the manual that came with my 2510, the display is only that. a frequency indicator, not a counter. it also suggests a 10 minute warm up period to stablize the vfo.
the specs also give a freq tolerance of + or - 300 hz which won't show on the 2510 display either.
there is a non-chipswitch mod that i saw for the 2510 in a ham magizine about 15 years ago that connects a different transmit mixer xtal through a small relay that is activated by the key line.
it was for fm repeater offsets.
the article warned that the display would not reflect the new offset frequency.
knowing where rad shack radios are built, (the far east), it wouldn't be too far out of the question that you may have got a defective one.
5 years ago, i bought a "brand new", (back plate said mfg in 1978),
midland 40 ch cb at a yard sale.
it was in such good shape that if they still made the same style of radio today, you could have put it on the shelf and sold it for new.
i spoke to the owner at the yard sale and asked what if anything was wrong with it as i like to buy damaged radios to fix up.
he wanted $8.00 for it and complained that from day one there was too much noise in the receiver.

i took my prize home and checked it out and sure enough, he was right. it would receive 5 channels on either side of the channel that it was set on for a total of 11 channels at one time. it received them as though the radio was tuned to each one.
upon further inspection, i found that, from the factory, 2 of the 3 pins on the 455 khz ceramic filter were bent and soldered into 1 hole efectivly removing the filter from the circuit. after removing and reinstalling the filter, the radio worked perfectly. it now has 114 total channels with no new switches. (PLL02A board). it is the showpiece of my collection by virtue of it's condition. 53 radios in all.
i can't say that you're wrong about your radio but i have heard a lot of good about the HTX-10 for the price.
like i said, maybe you got a lemon.
good luck.
jeff

Terminology that you are not associated with. Get a CET my friend, then we'll talk.

As far as the heat sink goes, you and Chris (I mean Carl), seemed to have a hard-on about this so here goes nothing.

When you are designing an electronic circuit. You want to run as cool as possible. Heat is the worst enemy a component can have. You want the circuit to be able to perform at ALL LEVELS DESIGNED FOR AT ALL TIMES.

So let's just say that I designed a certain radio (HTX-10) that is to put out 25 watts or so. When I key up, I'm asking the finals in my amp stage to go into a class AB type mode and put out 25 watts of RF power with as little distortion as possible. The key here is "LITTLE AS POSSIBLE".

If I use a RF final with a maximum value (Pt/w for all you CET's out there) of 30watts, then I'm pushing the unit near maximum which distorts at 3.7db's at 28mhz. Now remember, this if the unit is running COOL. If the unit get near or exceeds Tl/c which is the temp limit, let's just say, 180' F, then you start to get distortion.

Have you ever run your linears or CB's to the point where they are hot, and then listen to how well your voice sounds and how clear you are???

That's why, when I design a circuit, I use allot of heat-sink area(metal type has allot to do with it, aluminum, copper, steal etc.) I make sure that my outputs won't be running near maximum at all times.

The HTX-10 would go into thermal shut-down right out of the box!!! 2min. of dead keying and the heatsinks are foooooo hot, down it goes.

Why do other 10 meter radios not have this problem. CAN YOU SAY SHACK???

Heat is a big problem and there are ways to fix it. But it should be done at engineering time and not at the end-user's place.

The unit I got was the only one in town. No other stores have it. If it comes back in before the sale is up, then I might try another unit. LEMONS DO HAPPEN.

I would mount the antenna then hang a single vertical wire frome the base of the antenna. This gives a vertical dipole that has a little more gain than the groundplane antenna and would be a little less visible. If you are running low power feed it with some RG6 coax and use a antenna tunner to match the radio to this 75 ohm antenna feedline sytem.

If the LSB mod is done right it can be a decent little radio. Of course there are better radios but you get what you pay for and the HTX-100 is a good value for the money.

I think you should add that you will need an RF signal generator for this to work. I can tell immediately if a radio is out of whack. Just tune to 27.185 on AM and tune for maximum signal. There are so many peopleon that channel that you can tune to the "average" of everyone and get a very good idea if you're on or off.

Well, it was from my car, sorry that should be "moHbEEl" so that ought to be worth some handicap points. :->

> There are few, if any UK stations with the capabilities to cross the
> pond on AM. I hope to change that.

Having spent much time in the kingdom of UK, I think it is safe to say running a very high-powered AM station (particularly of the splatter-box variety) will quickly get you well known with her magesty's post office.

My question to you, Phil, is I gather UK CB radios run FM from about 27.4125 to 27.9125, is that correct? Which channels/frequencies are most popular over there? For instnace, here channel 19 is always busy with truckers (lorry drivers). With this in mind, even when the band is wide open from here to there, I never hear any FM stations. And the stations I often talk to are running very basic equipment. Thoughts?

MC

This will work OK if you use 4 108" counterpoise radialssloping downward
slightly from the braid side of the coax at the feedpoint.Cheap
truck-driver mirror mounts work good.

A few inches could make it for the 10 or 12 meter ham band,no way to
tell without measuring it and it could even be a collinear VHF or UHF.

Greetings!

Neat!

Any SMDs on this Mic that you have to worry about?

One type of Power Mike from RS made for their line of 5-pin DIN CB
radios uses SMD's, and it's catalog number if 21-1177 - but it uses
2AAA type batteries.

Since you've metioned "Hearing Aid" batteries, I'm wondering if
they've changed the innards.

Wanted to know if this one used discretes versus SMD's.

While Dancing with the Mouse on Sat, 27 Nov 1999 19:45:13 GMT, the
Modem interrupted with an MNI from "MC 10kW Jesus
<qsl27@hotmail.com>", and the MotherBoard buffered this to Video RAM:

```
:+> This microphone is made by Merry Microphone. I like it personally. Instead
:+> of the expensive 7V battery for the unit, you can buy a pack of hearing aid
:+> batteries and use them. I forget the battery number off the top of my head,
:+> but they are the bigguns that Radio Shack sells. You can probably get them
:+> cheaper elsewhere though. When you buy them there should be no tax as they
:+> are a health product. Wrap up five of them with a small piece of sticky tape
:+> and insert. The battery cover will hold them in place. You can also modify
:+> the microphone for considerably higher output. Inside there is a 1k5
:+> resistor that forms the negative feedback for the built-in amplifier. Change
:+> this to something with a higher value, say 18k, and you'll find the output
:+> comes up in fine style! I had one that I removed both the 22n capacitors and
:+> this widened up the output bandwidth a lot. I believe that if you short the
:+> 47k resistor together you'll defeat the noise-cancelling function.
:+> Unfortunately, somebody broke into my rig and relieved me of mine. :-<  I
:+> guess I'll just have to get another one.....:->
:+>
:+> In short, plenty of tricks with this mic!
:+>
:+> MC.
:+>
:+> Spike wrote:

How does a Cobra CA-75 stack up to a Astatic D-104 handheld? I was told that if I put a D-104 on my radio that it'll bring out the clarity and richness in the sound. True or false?

Sorry dude, but that RS radio sounds very good on the air and has a good sensitivity and S/N ratio. Rec. audio is excellent. However, it suffers from a poor choice of xtal filter design thus getting "splashy" from other ssb stations on contest day. This is a 10 M radio, right? From the sounds of your post, you received a defective or poorly adjusted radio. It happens to the best of them, ie icom yaesu, kenwood. It is a hell of a radio for $150, certainly better than most if not allthe bootleg 10m radios selling out there. One rotten apple doesn't necessarily spoil the whole barrel.

In article <383F6E6F.EB049C78@montero4x4.com>,

  Jason Anderson <jason@montero4x4.com> wrote:

figured turnabout was fair play since you were sending a
few barbs my way ole boy.
  Your speculation about me being a tech-head is way off.
  I just happen to think CB linears are idiotic. Guess we
differ on that one.
  Glad you met a few nice hams at the swap.
  Tell you what, next time I go to TRW let's meet and I bet we can
cast aside all kinds of misconceptions.

Works perfectly and is sold AS IS.

Now there's an oxymoron if I've ever seen one!!! Hmmmm.

Seems to me toll has something to bitch about in every new post that there is. Seems he enjoys getting things going with the group. Then tries to make the other person look bad to the group. Just hope you all have your eyes open and see that toll is just being a fucking asshole. Toll your not the fucking KING of CB. So stop acting like it. Before you say I didnt say I was king I will answer you right now, YOU ACT like you are so fuck off and unless you have something usefull to say to help someone then dont bother posting.

Hi Andy,

As far as I know the Realistic Noise Cancelling microphone is discrete components only and uses the 7V battery. I must confess I haven't purchased one in a while so it is possible that they've changed it. Knowing Merry Microphone's products, I don't
think any of them use SMDs!

The C.E.T. isn't worth much if you think you're suppose to take a 25
watt PEP radio (HT-10) and run it at 25 watts.

Depends. The D104 M6B makes your audio a little "tinny". The D104 575 can be adjusted for bass and/or treble. Now the CA-75? Never played around with those mics.

When your radio is modified with the AMC disengaged or Modulation Limiter cut, the M6B would overmodulate and maybe squeal "because of its tinnyness" where as the 575 can be turned down via the mic's "volume" and the tone can be adjusted for base. Other people will have different opinions about this but that's how I look at things personally.

On the other hand, I prefer stock mic's because the use of the radios mic gain and less background in my audio. The trick for all radios is to use Cobra 148GTL/GrantXL stock mic 600 ohm'ed element because of audio quality within its coffin chasis. I don't know why that is but I get better audio quality out of that particular mic than with Power Mic's. Once again, other people might agree with me but then they might have their own opinions.
Just my couple of pennies...

137... back out!

I was wondering if anyone has ever heard of this mic. I just rounded up 2 of them for free still in the box and with all the papers untouched. They have been used a little, but they look in A++ shape. They take a 7volt Mercury battery by what the instructions say.

Specs on instructions/Manual

Conrac/Turner (turner in big letters)
Model M+3, Ceramic, Transistorized.
Gain Control: Slide action
Frequency Responce: 300 to 3500 Hz
Output Impedance: 1000 ohms
Power Supply: Ray-o-vac #1501 (or Equivalent)
Battery Drain: 0.9ma
Battery Life: 6 months
Cable: 3CIS, Coiled cord, 11" rectracted 5' extended, medium blue, Hypalon Jacket.
Weight: 260 Grams (9.2 oz.)
Case: Cycolac, light blue front, medium blue rear.

I was wondering how these sounded, if they were keepers or sale to someone that is a collector. The boxes are almost mint with manuals, padded envelope (Jetpac) for Mic, plastic that covered mic, manual, sheet with specs, and metal mic holder never out of the brown sealed bag. The price $39.95 is printed on the box.

Thanks, JT

Although they were supposed to be playing the "Watergate" tape at about 11:30pm on Saturday night, the tape was still being listened to at 2:00am when my wife and I called it a night. I'm sure Steve at EXPORTSRUS will have the results for y'all. We did have a great time there again this year and as always, met some great people! Had an even better time seeing the people we knew from past trips and having dinner with a some really nice folks! I would like to say that some of the criminal element was about as there was a Suburban and a Caddy stolen from the hotel lot on Saturday and for those people it was a sad loss seeing that there was such a good time to be had by all that things like this would happen and dampen the spirits of those involved. To those who went to Memphis for the weekend we hope you all had a great time and with some luck we (my wife and I) will be back again next year. We'll be moving back to Jersey in June and will be going to more of the northeast corner gatherings.

I got this one in excellent shape, cleaned up like a new one. Hardly used, set for years in a dry place... got it on trade for a amateur radio. Oscilloscope usually don't do so well on Ebay, so you might get a great deal? Click on the link below to see pictures, be patient on the lower picture, it's large for a reason.

I don't know of any with information specific to that
particular amp. However, there are individuals out here
that may be able to answer any questions you might have
about it. For example, I have quite a bit of experience
with that model of amp. Feel free to e-mail me with any
questions.

Yet another one of the Prozac bendovers.

Amazing how so many people from the same town (traced by IP) have a
problem.....

The +3 is a compression type mic that works well on SSB because the
compression helps to keep your output signal at a higher average
value and more stable.  They have a fairly flat frequency response
that doesn't make them sound very impressive on AM, and, if you're
not careful about keeping the volume control as low as possible,
they will pick up a lot of background noise.  In other words, they
are definitely not a noise-cancelling mic.

So, in a nutshell, if you're operating environment is quiet, and
you use SSB a lot, they are worth keeping.  If your operating
environment is fairly noisy, and you're on AM most of the time,
sell them.

My RCI 2950 won't fit in another vehicle I use, so was thinking
about the Cobra 75 WXST...but I would like to give the modulation a

little help, if it is even possible for this radio. None of the mod sites have it, altho I did find it's predecessor, the Cobra HH70, which had a pot that adjusted modulation (but it didn't have Sound Tracker circuitry).

So I have two requests.

(1) I would appreciate hearing from anyone--who has actually identified the pot or VR for the AMC--on this rig.

(2) I would also like to hear reports about the performance of the 75 WXST from anyone who has used one. Does it even need the mod???

To respond by email, change the "nospam" in the address to "mediaone."

Thanks and 73s to all.

I stand corrected, 29.620. Thnxs QRM2000. I tried to hit the repeater about
5 min ago but nogo. The conditions are not good right now at this time of
the day-cycle.

I also just tried #39 (27.395) and was pushing 250 watts with swing on LSB
but nogo. I might need a beam for that one.

Anybody want to try 28.000 FM or AM??? I'm pushing plenty but the CB
activity is to much around this area.

73's and QSL, Jason

Hey Jason, keep in mind that the 28-29 Megahertz frequencies are the HAM
BANDS! Unless you have a license to operate there, PLEASE stay away.

Yes, that is split frequency, and it is fun to do especially if someone is trying to jam you. But a repeater would have to transmit AND receive at the same time. That is what full duplex is. Channels 25 and 4 are too close together and the transmit would overload your receiver and you wouldn't hear anyone. It's called receiver desensitization. It would be like having 2 CB radios connected to each other thru the coax. Transmitting on one CB would desense or even damage the receiver in the other CB even if you were on different channels. Repeaters usually use resonant cavity duplexers which attenuate the transmit frequency in the receiver which allows you to TX and RX at the same time without affecting your RX. They are also used to ensure the antenna is only transmitting the desired frequency and all other frequencies "bleedover" are attenuated. This is how many of the repeaters in the 10 meter and VHF/UHF bands are set up. There are lots of 10 meter ham FM repeaters in the 29.500 thru 29.690 area if you can receive them. They receive 100kHz down from the transmitted frequency.

Using phone lines or 900 Mhz phones to separate the RX and TX might work, but you would have to have a way to tell the transmitter to key up when someone is on the receive frequency. VOX (voice operated transmit) might work if your transmitter has it.

Alright. I see occasional postings of those who wish to show others their call sign/numbers to the group, but ever so occasional. I am going to start this off now.... I believe it would be a great turn out as long as many participate.

"148" in VA State
27.395 LSB/USB
27.385 LSB/USB
28.215 (I only listen on this frequency) <g>

I usually tend to stay on LSB myself..... Anyway, just doing something like I have done will help me compile a list so I know what numbers to start throwing/asking for. Take care.

Hank

I would like to offer something here.

When the 2510 came out I noticed they had a problem in the receiver that allowed strong stations to ride in on top of any other channel I was on. The problem manifested itself as a weaker but perfectly readable audio of the interfering signal coming in with the intended signal.

What I found to be the problem was a lack of isolation between the input and output leads of the IF filter. I installed a shield between and over the printed circuit side of the filter and this about completely stopped the problem. I also noticed the filter didn't have a good match on the input or output. Sorta' like a bad swr if you will. I added a couple of resistive impedance matching networks to the in/out leads to give the filter a somewhat better match to the remainder of the circuit. This cut down on the IF signal about 1-1.5 db but the loss was not bothersome.

Before you try one of those other filter units why don't you try adding at least the shield and see if that cures your problem.

Now that I think about it some more I also noticed there was a problem with cross modulation in the rf amp/1st mixer. This isn't that hard to cure either.

The problem will manifest itself as an imposed audio on the wanted signal whenever at least two close by stations are on the air. You can test for this by incorporating a switchable attenuator in between the rcv and the antenna. If you switch in, say, 10 or 15 db and the problem goes away you might be suffering from cross modulation.

The cure might be as simple as replacing the rf amp transistor or perhaps one of the input protection diodes is defective allowing a very strong signal to reach the rf amp without benefit of agc derived attenuation.

Naturally, without seeing or hearing the radio it is difficult to diagnose. But maybe these ideas will allow you to investigate further.

Good hunting.   BobC

news:384089CF.5DA89941@hotmail.com...

> This could be a two-way clarifier modification gone terribly wrong. Seen this before.
>

I didn't catch the original poster's question or any info pertaining to the nature of the off freq op or whether this is the 858 chassis or the 8719 chassis. I'll address both.

If the freq. is off but the channel selector is working correctly then you will need to touch up some trimmers.

Assuming the clarifier is modified, make sure the voltage leaving the clarifier control is steady. I'm talking about no more than a few millivolts change from keyed to unkeyed. If it changes more than that you need to troubleshoot down to the regulator to find out why this is happening.

If the clarifier has not been modified then you will need to set the tx frequency control pot to the same freq as the rcv. Ideally you would have a way of counting the frequency of the xtal osc. that the clarifier controls. If not, then you'll need to monitor the voltage at the point where the clarifier and the factory set tx frequency pot are summed towards the xtal osc they control. This will be at the point where the two isolation diodes are connected. Again, you don't want the voltage to change at all between tx and rcv.

You will want to check the reference osc. frequency of 10.240 making sure it's ok and not changing for any reason.

If this is a 858 chassis, you'll have three xtals do deal with. One for lsb, one for usb and one for am rcv. If it's a 8719 chassis you'll only have one xtal to deal with.

These are not difficult adjustments to make provided you have at least a good counter or voltmeter and a schematic.

If you are unable to fix the problem using everyone else's information supplied here than email me with more specifics and I'll try to walk you thru it. Let me know which chassis it is, the test equipment you have and what exactly is going wrong.

```
            Good luck. BobC

how serious are you about your cb radio??
 --MORE concerned with talking distance,or looks of your truck??
putting a ball mount in the side of your truck, would not be very
smart......You would be VERY directional toward the front, and your
transmit,and recieve toward the back would suffer a great deal........
The same goes for the dual 102" whips ,+ that looks like crap!!  Let me
remind you 102", is 8.1/2 feet . You said before that you are going to
be near low trees. Those antennas will hit EVERYTHING in the
woods.............I suggest going with the Wilson 1000 magnetic mount.
Put it in the center of the roof, right between the front
seats..........This antenna is BUILT to take a beating, and mounting it
in this location will give you the best all-around transmit and
recieve,.........& it doesn't look like crap!!!!  It is a little
expensive, but it works very well................ Buy it!!! , You can
thank me later.........

There isn't a radio that will stop the splash from that. The only thing that will help is using a beam on the flat side and in the opposite direction. Even that might not help so much with guys like that.

Try these. The 2950 and 2970 are virtually the same except for the power output. The 2970 has 50W AM and 100W SSB, other than that they are both the same. I have two 2950s and have made mods to them both. They are good radios but not legal for CB but...

Have fun.

Greetings!

I agree with your statement about the quality of Stock mikes.

It's the fidelity, I guess.

And re-work some of the Mic Gain section makes using the "Stock"
microphone well worth it. Simply because of the price of parts for the
change is listed in cents, not in Tens and Twenties.

While Dancing with the Mouse on Sun, 28 Nov 1999 15:48:31 -0800, the
Modem interrupted with an MNI from ""Mr. 137"
<ac137nospam@iwvisp.com>", and the MotherBoard buffered this to Video
RAM:

I found this website ran by Panther Co and they have a mod to increase the receive for the DX 2517. First I like to know if the RCI-2980 has the same internal board. Second I am trying to locate D30 and D31 without the help of a schematic. Can someone help me locate these two diodes by giving me other part # that are next to them. I think I found D30 but part of the 0 is covered up and could be D36 this is located next to a crystal in the lower left hand side next to IC10 end closest to front of radio. I also have found what I believe to be D31 but could be D37 close to VR 7. Does this mod work well enough for me to do the job? Please E-Mail me direct. My radios serial# is 903918 I can't find the Circuit board # and have to assume this is the EPT690010Z board . Any help appreciated

Just thinking.....could that frequency have been 29.620? You would be more likely to hear FM in that spot.

And, if it IS 29.620, be aware that this is a repeater output frequency. When the band is HOT, you will hear folks from all over the world -- not necessarily through the same repeater. It is a weird effect as you hear repeaters fade in and out.

mdwade has noted:
Got an exhaust brake on Pickup, Dodge Diesel 2500, and in Canada, Jake
Brakes are prohibited for use in popuoated areas.  Got warning from
RMCP when he heard it coming down the Mt in BC.  Works great.

Dear John:
You better hop over to www.thomas.gov and look up HB2346 which is in the
telecommunications subcomitte in basket.  Mr. Billy Tauzin (R-3LA) is in
charge and the local cities are getting him warmed up for this one.

Well you have to stop showing how little you people know. First of all I live as far from the "big apple" as you can get. Secondly you are all using lame ass programs to try and get my info. If you want to get someones info on who made a post that is easy you just right click it. I was reffering to the Emails that toll sapossably had received. Let's see him trace those. Damn stay out of it unless you know what your talking about.

who still services this meter, it dosn`t work properly,it a fwrd / refl
meter with 2 meters
with 2 settings 0-200w and 0-2k w, ok heers
the problem with any power setting on the meter or input the foward
meter works fine but the reflected meter gets peged, is this fixable?
thank you for looking

Please, I told you. I'm not *that* type. :->

> I have a good idea of his name and location but would appreciate confirmation.
> Kindly e-mail me at this screenname.

Chip, you don't have a clue who I am. And even if you did my name would mean nothing to you, or anyone else, anyway. I really think that you should make an appointment with a mental health professional. Your behaviour on the rec.radio.amateur.antenna group is not in keeping with recent socially-acceptable norms - even by liberal Usenet standards. Take a lead from me and post some useful information that others can benefit from instead of your threats of lawsuits or your scathing rebuttals to postings that only you misinterpreted.

And quite possibly the most remarkable thing is that you've never asked me who I am!
Now get out of my face before I have to bitch-slap you with my keyboard again.

MC 10kW just got down....

Yo Mike, go easy on Bill. He's not wrong and nor are you. There is another way of achieving a noise-cancelling function. Dynamic microphones exhibit what's called "proximity effect". This means that when you shove your face into the microphone and talk it will wildly exaggerate the base response. Stand up comics make great use of this! You can design a single-element microphone that takes advantage of this proximity effect. However, it has the appropriate tone-shaping to make the output sound un-bassy. Ceramic microphones don't normally succumb to the proximity effect and are in essense somewhat noise cancelling already.

I own 3 Uniden grant XL's and was looking at the new uniden grant LT and was
wondering if they use the same 8719 PLL chip and if not it is possible to do a
Channel mod on the Grant LT and if so where I can find info on it. Thanks
Please E-mail me as I don't get the chance to check this MB mutch.

You are correct sir. The underside where the coax shield comes out
should touch the metal of the bumper. Firestik has several different
coax terminators for this purpose.

Whew! Sorry if you work for Motorla and I ruffled your feathers! The fact remains, single band equipment will outperform rigs designed to cover 1.6 to 30 MHz--which are, by necessity, a compromise.

You mentioned Uniden. I was thinking specifically about the RCI-2950/2970, etc. I've run them side-by-side with general coverage big-name radios costing nearly ten times as much. There's no getting around it. The RCI receivers are H-O-T!

Perhaps you and I can agree to disagree on this subject. Want to move on to my next point--trying to tune up and down through a band looking for random contacts? Or have you ever used one of the ITU-style radios? If not, we probably should skip this discussion.

A COMPARISON:
A ship's chronometer is a special kind of clock. It isn't all that accurate. Its value is that it gains and looses time at a predictable rate. A daily correction factor is recorded in the log, based on temperature, barometer readings, and humidity for the past 24 hours. Thus, the face of the clock does not display the correct time, but the correct time can be determined by using the correction factor. You would not want something like this as a wrist watch. But it made navigation more accurate for centuries of seafarers.

By the same token, the Motorola SSB unit is great for what it is designed to do. While it is an item of curiosity to CBers, it would never make the "most popular radio" list on 11 Meters.

Greetings!

A means to open the exhaust valves to lower vacuum inside the motor, slowing down the intake of fuel from the intake manifold. Leans out the mixture and prevents blow-by when manifold vacuum can litterally cause valve seat and seals to fail. It recycles exhaust fumes back into the cylinders - also cooling off the motor.

When the valves are shut, little combustion takes place, the fuel is too lean to burn easily. Since this doesn't generate power, the engine simply squeezes air in the cylinders and forces the engine to work against the torque the drive shaft places on it.

It's used for decelleration to slow down the mass of the truck without smoking the brakes trying to slow down or stop.

While Dancing with the Mouse on Mon, 29 Nov 1999 14:11:22 -0600, the Modem interrupted with an MNI from ""Kevin Muenzler WB5RUE" <wb5rue@stic.net>", and the MotherBoard buffered this to Video RAM:

Greetings!

While Dancing with the Mouse on 30 Nov 1999 02:48:10 GMT, the Modem interrupted with an MNI from "gtoyama@aol.com (GToyama)", and the MotherBoard buffered this to Video RAM:

:+> I have a mag-mount with stainless whip. 2 questions:

Ok...

:+> 1) does SWR change if antenna is transferred between vehicles?

Yes, it can. If you use a different style of vehicle [e.g.- Truck versus Geo Metro, quite a difference in amount of metal] and the location where you place it will have an effect on SWR.

Always a good idea to check it after you've got the antenna on the other vehicle to make sure it's ok.

You only need to do it once, to make sure it's set. Then once you know the match between the two vehicles and their respective locations, you don't need to "re-check" all the time. Just put the antenna back in the same spot on each vehicle and you're fine.

:+> 2) for a given vehicle/antenna combo, does SWR change if a different
:+> radio is
:+> used?

This is a tricky one to answer, in a word no.

At least it shouldn't change.

I do know of some radios, when they've been peaked and tweaked, they can change the meter SWR because the output impedance is different and it shows up on the meter.

As long as the SWR is below 2 you're fine.

Regards!
:+> Andy <+:

Greetings!

Wise words!

Good points.

If the gentleman is looking for recommendations, I suggest Uniden pre-1994 stock.

Especially if it's in good shape.

The ones made in the Philippines are the ones that have the better boards.

However, some older radios can be found at Garage Sales, they may not work, but usually it's a simple TX capacitor or Transistor in the TX section that made them throw it in the bargain bin in the first place.

A little fix up and you're with a good radio again.

If you don't want to do that, another good source for radios, is from a CB Shop locally around you. A lot of times, people upgrade to another radio and trade in their older one. This is not the cheapest route, but at least you can ask to see if the Shops' "tech" has gone over the radio and given their "Stamp of approval" to re-sell it.

CB's are like old friends, many people take care of their equipment, and don't really want to part with it. [I know I'm that way...it shows!]

When they do, they are parting with an old friend. They may need the money, but they also want to make sure it "Has a good home".

A lot of it has to deal with how the person conducts themselves over the air. You can run into a "burn" or two dealing with used equipment. So paying attention to the persons actions and conduct usually gives you a strong hint as to how they treat their equipment.

While Dancing with the Mouse on 29 Nov 1999 11:50:00 GMT, the Modem interrupted with an MNI from "redhicks@aol.comnojunk (Debbie Hicks)", and the MotherBoard buffered this to Video RAM:

RED wire is + positive 12v

Black is - minus or ground

green goes to mike jack Key radio line - disconnect the key line from the mike jack and put the green wire there

yellow wire is for the key radio line into the radio that you disconnected from the mike jack

white wire is the audio wire connected to the mike jack

orange wire(s) are a disable wired to a SPST switch.

about $35 to $65 is all your going to get out of a 5 tone RB

>

LOTS of bucks! Also not suitable for use on 10 or 11 meters ONLY. You will get better receiver characteristics in a single-band radio which doesn't have to compromise performance to cover 1.6 to 30 MHz.

Also be aware that the Motorola SSB unit is designed for channelized operation, such as in the ship-to-shore and air to ground services. It is awkward to "tune" up and down through a band segment looking for random contacts.

On the plus side, it will last FOREVER!

QRM

Agreed.  No we are not going out of business, instead we are growing again.  We
did shut down the business Thursday, Friday, Saturday, and Sunday, went to
memphis and stayed on the line winning for 2 hours at the shoot out with our X
Force 4 pill.  Batteries got low and lost after tieing with AT&T for the final.
 11 vehicles in all is what the Mini Van, X Force Box, and "55" built antennas
took out.  As of Monday, business is back to normal.  Thanks for the  thought.

 That's a early C-band satelite dish rotor power
supply,maybe with a directional control switch which is a
polarity reversal switch.
Good for use as a 36 volt power supply at fairly low
current.

It's pretty hard to blow a 477 unless you do something
really nasty to it.... hell, the 2510 doesnt even have the capability
to overdrive that final to begin with.

After modification, you should see 26.615-28.305  and it is a pretty good
radio.

Planning on buying a CB when I get my new truck soon (can't drive a 4x4 without one) but I was wondering about the quality of new radios compared to older used ones. It seems like everything these days is made cheaply, to be replaced in a couple of years (hope my new truck won't be like that :-)   Any thoughts?

Methinks Mr. Anderson may have indeed ended up with a "problem child" w/"infant mortality" problems.

I ran my HTX10 into a Cantenna, thru a Kenwood antenna tuner w/switch, SWR & wattmeter - interested in how hot the final fins would get. FM mode, keydown for 1 minute; fins "warm-hot", a little less than that of my 50W 2m rig. Best I can tell from the small meter face was that it put about 28W out (it could be 25-30W).

Can't yet speak to frequency issues. Since the "clarifier" seems to be always active (i.e., not switchable in/out, you need to keep it centered. And if it's not on-freq w/centered clarifier, the 4.5MHz ref osc/clock osc for the PLL/CPU needs to be adjusted so it's on-freq w/clar. centered. An index dot or strong detent for the "null" setting on the clarifier would have been nice here.

The HTX10 will never be a 10M Kenwood 940S. But if it's not failed "customer QC" ;-) it's a nifty little rig.

A couple of thoughts :
1. Try and reason with the other fella and work something out.
2. Failing that get an equally large amp, give that a go for a while and then try option one again
3. When all else fails do what we have been known to do here in 43 division - either pin his coax (a whole heap of dead shorts in his coax will kill that amp pretty dead) or alternatively you can hook your 4wd (I think you guys call them RV's) to his tower and go for a quick drive down the road. If you are lucky you can get a radio or an amp to follow behind your car. This will maybe not solve the problem but will certainly register your disapproval!!

Why not use a quad loop? The gain is slightly higher than with a single

They are definitely keepers!

They were among the best in their day from Turner and continue to be very comparable to today's power mics.

The only thing you might need to do, depending on the switching needs of your radio, is to rewire the switches to work on your rig. Many of these had only one wire to ground for ptt and no provision for grounding the other leads for rcv. You may need to add the grnd to the other leads for rcv. No big deal.

Sound wise, these mics tended to be a bit on the high pitched side but if you keep the gain down to a nominal level, will sound great in a vehicle.

About the only thing that went wrong with them was the dirt would get into the slide control and the battery terminals would get a little dirty once in awhile. No problem.

Well like everything else in ten years it too will be old and the best made
compared to the new stuff.

A radio, regardless of what year it was made, will last a good long while.  If
it is taken care of properly.  If abused then you may have to replace it in a
couple of years.
Just like your 4x4.  Take care of it and it will last you a while.

How did you like all that talk around.

But really if you can find a good radio used then go for it.  Depends on how
```

much you want to spend. Beware of the radio's that may have been hacked up. Spend wisely and have a good time.

Alright. I see occasional postings of those who wish to show others their call sign/numbers to the group, but ever so occasional. I am going to start this off now.... I believe it would be a great turn out as long as many participate.

"148" in VA State
27.395 LSB/USB
27.385 LSB/USB
28.215 (I only listen on this frequency) <g>

I usually tend to stay on LSB myself..... Anyway, just doing something like I have done will help me compile a list so I know what numbers to start throwing/asking for. Take care.

Hank

Well hello, Jeff. Why are you posting your comments about the hams in rec.radio.cb in the rec.radio.amateur.misc newsgroup? Were you hoping the hams in rec.radio.cb would not see it?

Don't worry, I'll post a copy of this in rec.radio.cb so that the ham operators in that newsgroup won't miss what you've been saying about them behind their backs.

Hello Dwight: Maybe we should also post a bunch of stuff on rec.misc. But there's already way to much animosity going on there now.

Besides, what you reposted, Jeff has said it here many times. It kind of boils down to "WHO CARES". I am sure you can go back and run off new ham radio prospects on rec.misc all by yourself.

Which is why Amateurs respectfully ask unlicensed persons to refrain from transmitting in the ham bands. Besides the legal issue, you can think you are on simplex, or you're calling someone you hear, and you never realize you are being rebroadcast over a repeater.

There also are space stations operating in the 10 Meter band. It is easy to cause harm without realizing it.

28.000 would cause harmful interference to Amateur CW stations.

As another responder requested, please don't transmit above 28.0 unless you are licensed. This portion of the spectrum is populated by CW, SSB, Beacons, and space stations. It is very easy to cause great harm by transmitting on what you believed was an "empty" frequency.

The vacating of the CB bands by high-powered stations in other radio services was what allowed the Citizens Band to be created and to grow (and later to be expanded from 23 to 40 channels). CBers want other services to respect 11 Meters and not cause interference to CB communications. It is hoped that CBers, in turn, will respect the frequency assignments of others.

Remember, self-government won't work without self-discipline.

Bill,

You obviously don't understand how a Noise Cancelling Mic works...

What they do is generally have TWO elements. The idea is they both pick up all the noise in the environment. The two signals are subtracted from each other. The net result is that noise that hits both elements the same is actually reduced. When you talk into the mic, you are closer to one element than the other. By their nature, you have to get right on these mics to make them work so that you talk into one element very stongly compared to how your voice hits the other element.

The fact that it's a 'power mic' has nothing to do with the fact that it is 'noise canceling'.

Mike

Ever listened to your scanner and notice the chirps, tones, buzzes and beeps heard during transmissions between either police, fire / rescue?

Ever imagined of having a circuit to duplicate that -through your CB and listen to

the responses you'll get from others who are curious as to how/where you
got that catchy sound -compared to the jealous remarks as to describing you as a
dispatcher wannabe from "the locals" who don't even know who the hell you are
anyway
and couldn't careless if you knew them or not,

And some of them are either highschool teenagers showing off in front of their
girlfriends or their "good buddies" or just some low-life who hangs out at every
business in town
just to catch up on who's dating who so they can execute the plan of operation to
win your girlfriend over by telling lies about you and hanging all over your
girlfriend just to show you down in front of the town-folk and your friends who
are going to be at your wedding in a couple of days.
Sound Familiar!!
It Does Happen!!

Forget Them! They're Choosing Jealousy OVER getting a "Reality-Check"!

I am looking for a circuit / chip that will allow such tones to be emitted before
and/or after transmission.

Any ideas?

Tnx & 73s

You Know Who Said It :)

Calm down, Dwight, try to recruit not drive off people.
ur overzealous attitude will only turn off people. There a lot of
cultural differences between CB and HAM, try to understand them.
(IT AIN'T THAT FAR APART, REALLY) Many hams started with CB and still
use CB (I BES ONE), so lighten up, trun off the ego and try and listen,
ypou might learn how to recruit (A SALESMAN U AIN"T).

73 de Martin N%PZJ  Advanced CLASS
1. remember, in life, have class, not clASS.
2  to get friends, be a friend
3. it is nice to be important but its more important to be nice.

But do they full duplex or half duplex. I think you might be talking about
split frequency which is half duplex. Talking on one frequency and
listening on another frequency. This would enable you to use repeaters, but
it would not allow your radio to become a repeater. I have a handheld radio
which has the 144MHz and 440MHz bands, and the frequencies are far enough
apart that I can set up the radio to be an actual repeater. It's called a
crossband repeater. I can sit back and watch one person transmit on 144Mhz
and the radio will begin transmitting simultaneously on 440Mhz. And vice
versa when someone transmits on 440. But the difference between the TX and
RX freqs is 296 MHz, which is enough for someone to use the same antenna to
TX and RX at the same time without interference.

You will not!!! That is a BIG LOAD of crap. Gee, everyone!! Buy a uniden
CB/10 meter radio. It will outperform a carefully engineered mil spec unit
from the premier RF equipment manufacturer in the world.
Yes sir eeee..... What an idiot.

PLEASE SCROLL TO THE BOTTOM OF THIS POST FOR A FULL COPY OF THE TEXT OF THE
POSTING THAT IS BEING ANSWERED HERE.

>Auchtung Ver Botten! <-PLL02A and Hams Again

> my
>> chances of joining the ranks of amateur
>> operators is about as good as my
>> joining a neo-nazi or faciest or communist
>> organization. NILL!!!
                              jeff

thank you for proving my point. need i say more?

YES!!!

>Why are you posting your comments about the hams in
>rec.radio.cb in the rec.radio.amateur.misc newsgroup?  Were you hoping
>the hams in rec.radio.cb would not see it?

no, as a matter of fact, if i were worried about that, i would have sent it as
```

a private e-mail. i felt, and still do feel, that what i said needed to be said as it was pertenent to the conversation.

>>Don't worry, I'll post a copy of this in rec.radio.cb so that the ham
>>operators in that newsgroup won't miss what you've been saying about
>>them behind their backs.

thank you for saving me the trouble.
if the post that i was responding to were on rec.cb, you wouldn't have had to go to the trouble as it wouldn't have changed anything as to it's content.

>> if there's a jammer out there, bitching
>> about it on these ng's is NOT the place
>>to get it fixed. take it to the FCC.
>> same with rec.cb.
>> if there is an out-band or power problem.

>> a group of people that could be
>> friendly and have a good time.

>> I WILL BE THE FIRST TO SAY THAT NOT ALL HAMS ARE THIS WAY!!!

>> the basic premis of ham is very attractive

>> should it improve, i'll be the first in
>> line to get my ticket.

HERE'S THE UPSIDE.

i presented a discaimer that not all hams were involved in the problem. i gave constructive resourses to utilize to aleveiate their distress. also, i said that the ham hobby IS attractive so as to not disparage the basic idea of the ham hobby.
i even admitted that i would someday like to get my ticket too in the event that some changes occur.
THIS IS NOT TO SAY THAT HAM SHOULD CHANGE JUST FOR ME.
i'm only saying that i will sit patiently on the out-bands and wait. if things don't change, i'm content to stay where i'm at.

HERE'S THE DOWN SIDE.

>> you should go to rec.radio.cb.
>> all of the posts there from the RF police
>> who try to shove their opinions down
>> the throats of the cb'ers there make
>> them sound like a bunch of goose stepping,
>> lock necked idiots that would chase a dog from a gut wagon. the way they
act

>> poisoning the hobby to death.

as a ham that holds the views that you do, (for which you are entitled), i don't expect you to accept that there are more downs than ups here or admit that these things actually go on here but, these are the facts, like it or not.

just for your entertainment, i'll post this to rec.misc. in it's entirety so the people there can get a more balanced view of how the RF police try to stifle communications in any form through intimidation or a weak attempt at

embarasment as you have here, (it didn't work), RF or the net, by anyone who doesn't conform the the laws set down by the RF police.
i only make one request. please, next time, post the original letter that i responded to so that the people here can get the point behind what i'm saying instead of taking things out of context and leaving them to wonder what the hell you're talking about or mis-construing what i'm actually trying to say. believe it or not, most people here are adult enough to form their own opinions, pro or con, or draw their own conclusions without the benefit of your biases.
on top of that, one of the guidelines, which i admit i've broken a few here, asks that we keep cross-posting to a minimum. this is what i tried to do. rec.misc is a separate forum to which i posted a response to a posting there. by bringing it here, it appears that you get troll of the year award for breaking the crust on the top of the shit pot here.
the crust had hardened here several weeks ago and the stink had pretty much gone away here but you had to come in with a hammer and a spoon and stir things up.
i'm rested and up to the fight that you've brought here if your interested in continuing it. i went to rec.misc. and expressed my views so as to spare the people here the verbal bloodshed that occured here several months ago but you had to use your drag and drop to bring it here.
no one ever said that the hams couldn't go to rec.misc and look around. at the very least, you could have posted something like "hey, look here" and directed people to it instead of faning the fires of discontent in this ng. this is what i was trying to avoid for the sake of everyone here.
everyone here thanks you for your input and warming up this ng for the winter season. it will save a lot on energy bills.

> Don't worry, I'll post a copy of this in rec.radio.cb so that the ham
>operators in that newsgroup won't miss what you've been saying about
>them behind their backs.
>
>Dwight Stewart
>

it seems that YOU are the one that is lumping all hams into one pile, NOT me.

>> I WILL BE THE FIRST TO SAY THAT NOT
>> ALL HAMS ARE THIS WAY!!!

another problem with your slanting, rantings is the fact that this is the FIRST and LAST time that i've gone to rec.misc.the only other ng. that i've gone to has been rec.amateur to which i've ONLY posted answers to questions and, in one case, asked several questions about FCC and Canadian regs. i worded those questions carefully so as to NOT inflame ANYONE and i got several answers from several hams who's attitude in no way resembled the attitude of the RF police here. it was refreshing.

you try to make it look like i've been trolling the other news groups JUST to stab the ham community in the back.
this display is totally untrue. in case you don't remember the firestorm of a few months ago, if i have something to say to ANYONE, i'll come to them up front, eye to eye and say it. i had been complaining about RF police

blindsiding here for quite a while and don't intend to start being a hypocrit and do it myself.
even though i don't agree with your's or other like minded views, i welcome any dialog in my mail box. it's always open. it's easier than having to search the news group to find alternative views and defend myself against attacks for my posts. this is what i reffer to as blindsiding. this is why i click the "e-mail" box unless otherwise asked not to.
the only thing that i consider spam in my mail is from unsolicited commerical interests trying to sell me something as i wouldn't buy anything from the net.
next time, at least try to post things in their entirety so as to give everyone a FULL view as to what is going on instead of bending things to fit your opinion.
thank you and have a good day.

jeff

BELOW IS THE FULL TEXT OF A POSTING TO REC.RADIO.CB FOR YOUR EXAMINATION.

a chipswitch won't help you as it is just a different processor.
you might try a channel guard obtainable from cbc international or maybe crb research. both have a web site. all it is, is an extra IF filter that you can install to make your receiver band pass tighter.
good luck.

if built properly, there isn't a lot of difference between a cb linear and a 10 meter linear as for their intended purpose except a few khz.
it seems that elmerism has been replaced by eliteism.

I have a Realistic TRC-212 (21-1662) for sale. This is the full size

40 channel unit with carrying case. High/low TX power switch. Around 5 watts output on high. LCD display with TX and receive meters. Great shape. Original long (around 5 feet) center loaded antenna. Has external antenna, power and charging connections. Has an 5-pin external mic connection as well. Uses 8 'AA's or 10 'AA's rechargeables and you can recharge the batteries WITHOUT taking the batteries out. (Batteries and charger not included)

Asking only $ 40.00 plus shipping.

A Picture can be e-mailed.

I mounted my switches next to the speaker on the case on my Grant XL. I have 3 switches for my X-tra channels, 1 switch for my 10k jump, one to turn my talkback on and off. (Need it off with the amp on), and 2 dials for my galaxy echo/VC/Robot board and one for Varible power. They are all mounted on the bottom of the radio. It all depends if you want to drill any holes in the case of your radio or not. I had an old case for mine so I wasn't to worried about drilling any holes in mine. Hope this helps. For some killer mods and a way easy Channel mod for the grant XL visit my web site at

I don't know what that story was about but I has a schematic for a roger beep you can play with the oscillator section and chance the tones. or replace the oscillator with and pre made sound chip like in a Xmas card or something but don't forget to lengthen the time constant.

www.bayshorenetwork.com/rbeep.html enjoy!

> And we've answered that question many times before, Jeff.

yes, but if it isn't answered accuratly or truthfully, it is at best, worthless, or at worst, damaging.
there have been many postings here by the more, shall we say, agressive hams that were outright fabrications. example:

the posts that threaten to turn over e-mail addresses or posts to the FCC that

discuss cb mods or amps.
this is bullshit as it is only hearsay and can not be acted upon bu the FCC as their case would fall apart in the first 15 minutes of the law suit brought against them for lack of probable cause.
if the FCC were to come and ATTEMPT to inspect my station PURELY on someones say so because of a posting here, i would soepina the name of the person that turned it in and make that person defend his evidence and charges in court or face prosecution for malicious prosecution as they would be making charges against me, sight unseen with no hard evidence other than a shitty attitude and a difference of opinion.

there are also some who try to put out the impression that happy hollingsworth will jump to their beck and call so as to suggest that the first time someone keys on an illegal radio, the FCC will be standing on their door bell before the key click dies.

these things just lead to either paranoia for the people who don't know the FCC's agenda or laughter for the people who do.

> Many of our
>old friends still only have CB radios, so we keep our CB around to talk
>to them.

good for you. so what's your point?

> And we've addressed this also, Jeff. None of use has ever said that
>CB is bad, only that there are some illegal users who make it bad for
>everyone else.

on the flip side, there are SOME hams here who abuse us unfairly and make it bad for some of us here.

> When you apply those same standards to yourself, we'll follow your
>lead, Jeff.

PROMISE???
i don't start the shit here, i just try to clean it up to you can't put this one on me.
i don't post inflamatory comments here, i just answer them.

> You're the one in here ranting about ham operators.

and YOU and the rest of the RF police are the ones that are ranting about cb'ers, so what's your point?
you and your ilk are the ones who started the conversation.
before the shit hit the fan, there haden't been one single post complaining about hams and their activities as your operations are none of our business.
you've brought this upon yourselves.

>If you
>can't help someone

i try to. i post answers, when i have them, to peoples problems. i also try to counter the RF police's contention and attitude that they have a God given right to control other peoples lives.

>don't like the subject matter,

i don't like yours and you don't like mine.
even score on this one except for one fact.
you've brought your arguement to a forum that doesn't have a whole lot of sympathy for your cause. it's like campaigning your political views in the other partys headquarters. it is wise policy to come as an ambassator than a warrior so as not to generate ill feelings when you first walk in the other guy's camp.
it wouldn't make much sense if i were to go to rec.amateur and start touting my pro-out-band views there. it would just be an invitation to be the guest of honor at a firing squad which is exactly what happens to you and yours here. i mean it just stands to reason that you don't stand in the middle of a battle field, outnumbered and tell the enemy just how stupid you think he really is.

>or don't have
>anything positive to contribute

ah, but i do, you and your ilk are the "voice of rightiousness". i add some balance to the mix for opposing view points. i thought this is what has made this country great. not the attempts of the RF police to stiffle opposing viewpoints or the free flow of information that this country was founded on. does the first ammendment ring a bell?
you may say that i am trying to sitffle you and yours with my position. if a hate group were to come in and try to intimidate some minority and the government came in to stop them. would the government be violating the free speech rights of the hate group? i think not as the government is recognizing more and more that NO ONE has the right to inflict their views on someone else. there really is a line between the existance of opposing view points and the victimization of one group by another. the supporters of your position have brought the fight here to our yard so i would say that WE are the ones being oppressed. NOT you. you are the minority that is attempting to take control of the majority. NOT!!!
in case you haven't noticed, if you try to read my posts and the post that i'm responding to carefully and, for a moment, with an open mind, you'll find several things about me that i think you've missed.

1) there have been several non-agressive dialogs between myself and other hams who don't share my viewpoint. as long as they come into the conversation in a non-threatening manor, i do not attack them. we may part ways and still not agree with each other but at least we parted on a friendly basis.

2) there have been times that i have gotten very agressive but only with people who have taken an attitude with me.
just like any other battle, you always try to use a little more fire power than the other guy. otherwise you wind up in stalemate and acheive nothing. if we wern't out to change minds or support our respective positions, we wouldn't be having this conversation right now, would we?

3) if i happen to get an ACCURATE piece of information that is in conflict with

my views, and this has happened believe it or not with the help of hams, i accept it and stop trying to defend that particular viewpoint with the use of deflection, side stepping and outright bullshit as has happened here at the hands of the RF police. it seems that when confronted by facts that oppose their position, they run out of things to say so they start to attack other things like spelling, grammer, your education and, in some cases, even your mother, (in my case). when i request that they leave my mother out of the arguement as she is no longer on this planet to defend herself, i admit that they DO have the decentcey to respect my request.

several weeks ago, i got a lot of information from Martin, mdwade@mobiletel, an extra class licensed ham, about the FCC and the ITU. he provided useable references to look up. some supported my position and some did not. i've accepted the opposing information and have not used any of it as an arguement in support of my position as this would be a lie.
i posted it here in it's entirety, (i will post it again at the end of this post for your inspection), for the inspection by everyone in the ng. the next thing you know, the RF police came in like a pack of dogs and attacked one of their own apparently without checking his references first because they were still clinging to their party lines with all of their might in the face of facts that showed that, in some cases, they were wrong. all because the facts presented to them opposed their own opinions.
have a good day.

jeff

Jeff,
the interconnection between countries on ANY type of telcommunications is overseen by the ITU, The ITU was founded in 1859 to standardize telegraph connections between European countries as to allow for the rapid passing of traffic or messages. With invention of Telephone and radio, the ITU assumed duties in regards with the Cairo Conferance of 1906 which set up an international standards committee which came up with the phonetic allocation scheme (K,N, and W along with AA to AK for the US, G and M for the UK, D for Germany, I for Italy and so on). The ITU regulates the international usage of telephone, telegraph, data, radio etc. It became a dept of the UN when the UN was founded in 1945 and before that it was under the League of Nations in Geneva, Switzerland. The ITU is called a specialized dept of the UN and the Telephone money is a great source of revenue for some small countries. Radio is included since international conferences have delgated radio to the IYU since 1906. The IYU has set up the international allocations in regard to Marine, Business, military, amateur, radio telephone, medical devices and other radio services. The standard ITU agreement cover any type of electronic communication and is many pages long with technical BS from DC to Light. Every country on this planet has signed the ITU agreement since international interconnection depends on ITU standarization. Some countries are not close followers of ITU and some have no central functioning governments but those that do (about 99 percent of the world) want that telephone money.

The FCC administers the Civilian Portion of this program in the US and the NTIA (see www.ntia.gov) allocates usuage in the US for government and military usage on the Federal Level. (Some of freeband is NTIA stuff!). The FCC and FBI have concurrant jurisdiction with NTIA stuff. SCARY...

On the International level, ITU allocations differ from region to region, most of the Western Hemishpere is in Region 2 (Ham Test Question). CB radio in North America (Canada and the US) is 40 channel AM type emission (called A3 in ITU parlance) with a limitation imposed by only the countries themselves. In Cntral and South America, These so called export radios can be used on different channels since each country can set their own standards. (Hint: 26 to 28 Mhz around the world has been allocated to individual countries usuage, so each country may set up its own type of radio service as it wants). The high power stations from the south are mainly business types since VHF and UHF radio are so expensive. Costa Rica allows usuage of up to 100 watts ERP on Radio Personal which is their name for CB. Belize allows Business usage radio upto 35 watts on CB with extra channels available. This will shed some light on why CB is low priority with the FCC. The only beef I could see with this arrange and the ITU is that the ITU agreement states that the general usuage band we call CB can not be used for international contacts. Unless some country complains, the FCC will only pay minimal duty to the CB Band, however, some countries have been complaining about our CB and Ham Bands which I think has sparked the current round of enforcement. CUBA has complained about interference to its ham nets and repeater systems (We do pay some attention to Cuba since most Carribean telephone and microwave links pass by and through

CUBA by international agreement from Florida).

I would recommend looking at the FCC website, searching the UN and ITU with search engines, The ARRL has a portion (chapter) of the rulebook outlining the ITU and relationships.

The main reason I got an Amateur Radio License was to communicate with home and almost every country honors an Amateur license without fail, however, there may be some bookwork involved but recip licenses can be obtained and it clears the path for you to carry radio gear in some countries which have a different view about 2 way radio.

In Columbia, CB radios are illegal without licensure and possession of unauthorized radios will put you on a collision course with the local gendarmes. Had a friend who was a radio hobbist who worked in Columbia on a Drilling Rig in the Jungle. He brought his scanner and 2950 10/11meter radio and got through customs (Oil drilling equipment) but on the rig, his radio skip chasing got quick notice form the Columbian Authorities (HOW? I really don't know, but I suspect drug/guerilla fighting). The legal hassle without a license cost him his job and expulsion from the country. He was asked, he told them he was a Ham and they asked for a licnese and found he wasn't licensed for Ham in the US, he was told he would have been eligible for a reciprical license but illegal operations were another thing. A $100,000 a year job lost.

Since my last post about the HTX-10 that I bought last Wed. only to watch it die and was returned on Fri, I've gotten allot of heat for my complaints about the radio. Especially from Chris (or was it Bill or Carl???) and others slamming me for talking bad about a fine piece of engineering. I DID admit that maybe I got a LEMON, but that was the only one in the area that I could get.

Well, Sat night, I was in another major area and called a few Shacks on my cell and found one store that just received one that morning. So I stopped by and picked it up.

Chris, thought that I botched up the radio by turning every pot on the board and fucked it up myself. So for this test, I decided to leave it stock, take all the measurements and give you all a report. So here goes.

Nov28, Sunday :8:35pm PST.
Unit tested: HTX-10
Equipment tested on:
Leader Digital O-Scope/ Vectorscope (Waveforms) Model: Lt-1590
Elco Digital Audio Generator w/built in freq counter. Model:SG-9500: 10khz-300mhz
B&K Spectrum Analyzer: 150khz-1030mhz w/ 10hz resolution: Model: BK2630A
HP- RF Distortion and SWR/mw Meter: 1.8-500mhz : Model: HPi70555L
Sunco Digital Power Supply/ Dual Outputs 1-36v adj. 0-8amps adj. :Model: 890

Ok, the HTX-10 was tested using 14.4volts since this is was a car's electrical system will be putting out. Remember, this is a mobile unit. All readings hereafter are assumed at 14.4volts.

On the bench, with the unit on, it was pulling .4 amps (400miliamps) with no volume. At full volume with squelch down, it was doing .9 amps.

Scanning, keypressing, and mode changing affected amp draw only slightly.

IF Rejection according to the manual is 70db or better, but tests showed that it started early at 48db's (48.74 to be precise) so that's not as good as the industry standard or what Tandy says.

Sensitivity is supposed to be .5uV for 10db S/N ratio. It was actually better then Tandy stated at .3mV at 4 1/2 db S/N so this is a good receiver in this unit.

TRANSMITTER SECTION !!! MY FAVORITE.

My friend KE6PKI in Downey helped me on this one.

Power Output is 7w(AM), 25w (FM,SSB).... NOT!!
On FM, power was at a disappointing 17 watts with SSB swinging up to 23 watts. Amperage draw was only 3.5 amps at full rated power. On a dead key at freq. 29.000, the heat-sink would get hot after 4 1/2 minutes!! Much better then my first one at 2mins then shut down. It would take 7 for the finals to go into thermal shutdown and about 1min or so to cool enough to operate again. But with a normal conversation, the unit would keep up with no problem.

On AM, power was at 5 watts with little distortion. and the heat-sinks were more then adequate at this power level.

When we cranked up the power to go at the rated output, amperage was a little higher and it got hotter quicker but still sounded good.

Distortion is at 5%...... Very true
If the unit is stock and putting out under rated power, the distortion is at way below what Tandy says. Actually, it was around 2.5-3% instead of the 5%. Very nice and clean. Again, the amp section on this radio is very nice.

Deviation +or- 2khz........Wrong, or at least on my unit.
The freq that was being generated by the VFO inside the unit was off by about 4 to5khz depending on where I was on the freq range. At 28.000, it was 2-3khz off and at 29.600, it was off close to 5khz. If you were to transmit on 29.000, you were actually high at 29.004 or 5. This was kind of disappointing since this much off can cause problems in the conversation.

As with the Spurious Emissions and S/N ratio on the transmitter, they were all within range.

FINAL THOUGHTS ON THE UNIT.

For the sale price of $139, this would seem like a good unit for the first time buyer or HAM but with the quality control that Tandy seems to posses, each unit seems like its way off the rated specs. Granted, they are generous with the specs, but the power output, freq deviation and low current draw make this seem like a kids toy rather then a good solid piece of HAM gear.

AND THE WORD HERE IS "H A M" gear. This is not a CB nor was it intended to be mod'ed either. If you want that and you like the look of the unit, then I would recommend the Sidewinder 400. It has all the features, may put out less power but can go down to 11 meter and is only $129.

I've actually just ordered a 400, so we will see what happens. As with that, I will give a full detailed report on the 400 as well.

I'm going to wait for the 400, if I like it, then the HTX-10 goes back, if not, then I might keep the HTX-10 but crank up the power.

73's, Jason

P.S. The finals actually will put out close to 40 watts as long as you put a fan on the heatsink and keep them cool. Another reason to be happy with the AMP section.

NEWSLINE 163

Newsline report number 1163, with a release date of Friday, November 26 1999 to follow in

5-4-3-2-1.

The following is a Q-S-T. Post cyclone relief efforts continue in India, the F-C-C keeps the heat up in the U-S-A and A-P-R-S tracks down a stolen car in Canada. All this and more on Newsline report number 1163 coming your way right now!

(Billboard Cart Here)

**

HAM RELIEF EFFORTS CONTINUE IN INDIA

Ham radio is still providing much of the communications in the aftermath of a cyclone that devastated the Indian state of Orissa on November 11th. As reported last week, the storm wiped out all normal lines of communications into and out of the region. Much of the communications infrastructure is still in a state of disarray making Amateur Radio an essential part of the relief effort. Jeramy Boot, G4NJH, has more on the post cyclone ham radio lifeline:

Pkg Here

Again, those frequencies are 14 point 135 and 14 point 160 MHz on the 20 meter band. Unless you are involved in the relief communications effort, you are asked to keep clear of these two frequencies until further notice.
(G4NJH)

**

THE FCC vs. WA4JTK - LETTER NUMBER FOUR

The F-C-C's has written a forth letter to Alan Strauss, WA4JTK, of Carol City Florida. This, regarding his operation as net controller for the 14.247 D-X Group Net. Newslines Bill Burnett, KT4SB, has this follow-up report from Miami:

The November 19th note comes in response to a letter from Strauss to the chief rules enforcer Riley Hollingsworth, K4ZDH. A letter that apparently questioning earlier notes to him. Also asking about alleged statements credited to the FCC regarding net operations and callsign suffix only identification.

In his latest letter to Strauss, the FCC's Riley Hollingsworth reiterates that an earlier letter should be looked at as a warning that the FCC does not consider this matter closed. It also reminds Strauss that the FCC will continue to monitor the DX nets operations. Also that the FCC will expect the net to share the frequency and not commandeer it from already ongoing Amateur Radio communications.

Regarding station identification. Strauss had apparently questioned statements attributed to Hollingsworth that were allegedly made to at least one other ham. To quote Hollingsworth's response: "our letter does not conflict with statements made to Mr. Wilson regarding proper identification. Our letter to Wilson plainly stated that stations must comply with Part 97 of the Commission's rules."

Hollingsworth continues by saying what he has said before. That a station identifying by only two letters of its call sign, that is not recognized or acknowledged so that it can eventually give its call sign within the time limits of

Part 97, is in violation of the rules. He adds that as long as Part 97 is complied with, it does not matter how a station identifies in the meantime, so long as it is not deceptive.

>From Miami, I'm Bill Burnett, KT4SB, reporting for Newsline. Ken.

Hollingsworth's letter also reminds Strauss of something else in his earlier letter. A statement that two-letter identification, where Part 97 is violated, must not be condoned by his net group. (FCC)

**

WIDE SIGNAL GETS SECOND WARNING

And a ham who the FCC claims to be transmitting an excessively wide signal on 20 meters has received a second warning letter from the FCC. He is identified as Glen Craft, N5RQW, of Stringer Mississippi and last March 5th the FCC wrote him regarding what the commission says is his unusually wide signal.

Now, more than half a year later the Commission has again written to Craft regarding the same situation. In his latest letter to Craft, FCC rules enforcer Riley Hollingsworth says that Commission monitoring continues to indicate that N5RQW has been operating on the 20-Meter Amateur Band emitting an unusually wide signal or one that is over-power, or both. But that's not all. Hollingsworth says that information also indicates that Craft may have ignored requests from other licensees operating on adjacent frequencies to correct his transmitter emissions in accordance with good Amateur practice.

Section 97 point 303 of the Commission's rules prohibits Amateur stations from occupying more bandwidth than necessary for the information rate and emission type being transmitted, in accordance with "good Amateur practice.". Also, Section 97 point requires Amateur stations to use the minimum power necessary to carry out the desired communications.

Based on these rules, Hollingsworth has cautioned Craft that failure to remedy this type of operation may jeopardize his Amateur Radio license. (FCC)

**

ACCUSED CALIFORNIA HAMS RESPONDS TO FCC

Two California hams accused of interfering with a repeater says that they are not

the cause of the problem.
Newslines Roy Neal, K6DUE, has more:

Newsline has heard directly from Todd Young, W6TLY and Brian Frobisher, WA6JFK. The FCC had alleged that the two had been the source of interference to a number of Southern California repeaters.

But Young and Frobisher say that they have never been the cause of interference to the repeaters and Young says that he not even used these repeaters in a long time. According to Young, he left the systems after disputes arose between one of the system owners and several users. Disputes that he says he wanted no part in. Young says that he moved his personal on the air operations to other repeaters on 220 MHz and 70 centimeters. He says that he first became aware of the accusations against him when he heard them on Newsline and later received a copy of the warning letter from the FCC.

Since getting the FCC warning note, Young says that he has taken to listening in on the repeaters in question. He says that he is hearing numerous unidentified transmissions and what appear to be tape recordings played on the 449 point 920 and 445 point 680 repeaters. But says Young, these transmissions are not coming from his station and that he has told this directly to the FCC's.

Frobisher's story is very similar. He says that he received a warning letter from Hollingsworth claiming that evidence had been collected that he was responsible for ongoing interference on the KJ6TQ and the Crescenta Valley Radio Club's 2 meter and 70 centimeter repeaters. Frobisher says that he told Hollingsworth that the last time he used the KJ6TQ machine was back in 1997. He says that he left the system after hearing a young woman allegedly told not check into a net on the machine. Frobisher says that he also heard the system being turned off in the morning hours when the same young lady was just making a call on the repeater.

As for the Crescenta Valley Club, Frobisher says that he has used the 2 meter repeater in question sparingly, and only recently found out about the club even had a 440 MHz system. He says that he has done nothing on the Crescenta Valley club repeaters that could be in any way be considered malicious.

>Roy Neal, K6DUE

Both hams tell Newsline that they have been in contact with Hollingsworth to discuss the allegations. According to the F-C-C the matter is still under review. (W6TLY, WA6JFK)

**

APRS TRACKS DOWN STOLEN CAR

For most of us, having a car stolen is a traumatic experience. But for one Canadian ham it became more of the thrill of the chase. Newsline's Fred Vobbe, W8HDU, has more:

When Bill Guthrie VE6OLD of Bentley Alberta Canada woke up to find his van missing from his driveway, he did one thing before he called the police. Bill ran down to the computer, and had a quick peek. Almost instantly, the APRS beacon in his car told Bill's computer that his vehicle was enjoying a leisurely drive around the town of Red Deer.

Then, calmly, Bill picked up the phone and called the Royal Canadian Mounted Police. He reported the stolen van, adding that they could recover it and catch the thieves if they sent someone the red to the Red Deer location.

They did, and the arresting officers got even more than they were looking for . It seems some young teens needed a vehicle to haul their loot from a recent spate of break and enter robberies. Not only did the alleged thieves get caught red handed for grand theft auto, but the stolen goodies in the van tied them to those other crime scenes as well.

But that's not all. Obviously, the Royal Canadian Mounted Police wanted t know how the owner of a stolen vehicle could possibly know where it was. That was an opening for VE6OLD to begin explaining the magic of Amateur Radio's Automatic Position Reporting System. He also invited some of the officers to his house to demonstrate how APRS works. The mounties were impressed.

>From Lima Ohio I'm Fred Vobbe, W8HDU, reporting for Newsline.

This is the second time we've heard of APRS helping retrieve a stolen vehicle. The first occurred in San Diego a couple years ago. (N4NEQ)

**

INSTANT CORONATION IN THE BIG APPLE

Southern California is not the only area where last months D'wana Terry letter on repeater coordination is having an almost immediate impact. New York City and the surrounding areas may soon find the 144 to 148 MHz repeater subbands filled with repeaters trying to operate within 7.5 Khz of one another.

The idea to try to populate the splinter channels comes from a self professed instant coordinator calling itself the Greater Metro New York Coordinating Committee goes forward. Headquarters in the town of Maspeth New York, this group says that the time has come to make more repeaters available on the very crowded two meter band.

None of the F-M involved hams in the area that we have spoken with have ever heard of the Greater Metro New York Coordinating Committee. They remind us that there has been no publicly recognized repeater coordinator operating in the New York City for well over three years. That's when the problem plagued Tri State Repeater Council went away.

With no radio gear on the market for hams to use on 7 point 5 Khz repeater centers, and none planned by any of the major equipment suppliers, the Greater Metro New York Coordinating Committee is going have a fight to simply survive. (Press release)

**

BUSINESS REPORT

A ham antenna company calls it quits and makes the announcement on a ham radio Internet Remailer. Don Wilbanks, K-C-5-M-F-A has the information in this weeks ham radio business report. Don:

We start this weeks business report with word that yet another ham radio peripherals supplier is gone. According to reports on the V-H-F Reflector, K-L-M Antennas has reportedly left the Amateur Radio supply business as of October 31st.

>From the Newsline business desk in New Orleans, I'm Don Wilbanks, KC5MFA.

More with Don in future Newsline reports. (W6YX VHF Reflector)

**

2000 CALIFORNIA HANDI HAM RADIO CAMP

The Handi Hams Year 2000 California Radio Camp will begin on Monday, February 28th and run through Sunday,
March 5th. This at Camp Joan Mier in Malibu just North-West of the city of Los Angeles.

This very unique educational opportunity is open to all Handi-Ham members with disabilities. And thanks to a
special grant, this year campers who live West of the Rockies, or in Mexico or Canada may attend at no charge.

For more information or an application form, please contact Nancy Meydell at area code 612-520-0512 or e-mail
Nancy to nmeydel@courage.org. Be sure to include your full name, callsign if any, and postal mailing address.
(Handi Hams)

GEORGE RACE WINS THE RACE

The ARRL Great Lakes Division will have a new Director and Vice Director in January, but the Director really is not
new. He is George Race WB8BGY and his selection brings him full circle in what can best be called an ARRL election
dicotome.

Back in 1995, Race -- the Great Lakes Vice Director since 1990 --
assumed the Director's position when former Director Al Severson, AB8P resigned. In 1997, Race was defeated for
election to the Director's post by Joe Falcone, N8TI. But after only three months into his term, Falcone resigned.
This elevated then-Vice Director Dave Coons, WT8W, to the Great Lakes

Director's . Race subsequently was named to again serve as Vice Director.

Earlier this year Race filed nomination papers seeking to regain the top job in the Division. The ARRL Committee of Tellers on November 19th to tally votes. The count showed that George Race, WB8BGY, had once again been elected as Great Lakes Division Director edging out both Dave Coons and Murry Scott KE8UM in a three way contest, bringing this odyssey full circle.

Gary Johnston, KI4LA, will be the new Great Lakes Vice Director. He defeated Lawrence Solak, WD8MPV. Race and Johnston will serve three-year terms. (ARRL)

**

INSTRUCTOR OF THE YEAR NOMINATIONS SOUGHT

Still with League news, nominations for the ARRL Instructor of the Year awards are due to section managers by January 31 st of 2000. For more information on both these items visit the leagues website at www dot arrl dot org. (ARRL)

**

US NAVY ABANDONS RADIOMAN RATING

First the United States Military decided it no longer needed to use the Morse Code. Now the Navy is about to do away with the last vestige of its ties to traditional terrestrial two-way communications. This as it announced that it is abandoning the rank of Radiomen.

In a not so unexpected announcement dated November 4th, the Navy said that the rating of Radioman would be changed to Information Systems Technician, effective immediately. The announcement said that the Navy made the change because doing so is consistent with ongoing efforts to properly man and train its personnel to handle the changing environment of the information age.

But the Navy has made one concession to the past. It says that in keeping with the tradition of the Radioman rating, the rating badge of electronic sparks associated with the rating is being retained for the new Information Systems Technician. (Hudson Loop, TWIAR, published news reports)

**

AMSAT NET WEBCHANNEL MOVE

Bruce Paige, KK5DO, reports the Houston AMSAT Net has moved to a new Internet Relay Chat channel. Bruce says that listeners will find instructions on how to connect to the new IRC site on the KK5DO home page at www.amsatnet.com.

Bruce also says that the live stream Real Audio server is working and in order to listen to the live stream, you must have the Real Audio G-2 player. A free basic version of G-2 is available for download at www.real.com. (KK5DO)

**

AO-10 QSB ALARM

Jerry Brown, K5OE, also from Houston asks over the AMSAT Remailer if you have ever been stuck trying to find the AO-10 ham satellite and hear nothing but silence? Well Jerry says that he may have a way to know when that bird is coming into range.

K5OE says that there appears to be an alarm of sots that he has noticed that alerts him when AO-10 is emerging from a deep fade. It manifests itself as a low-volume carrier moving across the passband from high frequency to low frequency at about 1 Hz and about 3 d-b above the band noise. Jerry says that all he needs to do is to keep his receiver set to the downlink of 145.904 MHz. He can then go about his other business until he hears the telltale carrier as it travels by this frequency. Invariably, the next attempt at an uplink to AO-10 produces a return. (K5OE via Internet Posting)

**

DX

In D-X, Asia's biggest station A61AJ will once again hit the airwaves for the C-Q World Wide C-W DX Contest November 27th and 28th. Ali Al-Futtaim, A61AJ, has invited last year's Asian record breaking multi-multi back to Dubai. Team members started to arrive late on November 20th. While there they plan to do some minor maintenance on the existing antenna farm and install two new antennas for 160 meters and multiple beverage antennas for 80 and 160 meters. Look for activity on 10 through 160 meters, including 12,17 and 30 meters on CW, S-S-B, and R-T-T-Y before and after the contest. Q-S-L via W3UR. (W3UR)

And W0YR, K6CT and HA5JI will be active as 3A/W0YR from Monaco from November 26th to the 30th. Activity includes the C-Q World Wide C-W Contest. Q-S-L as directed on the air.   (OPDX)

And less we forget a still very hot six meter band. There, Alan Steivenart, ON4KST, reports that November 11th
was a great day for propagation in Europe. Alan is in grid square JO20. On the 11th he heard and contacted
stations in Australia, Japan and South Africa. Talk about your truly world-wide six meter D-X. (VHF Reflector)

**

CHURCH BELLS IN VK

And finally, church bells down-under may soon have ham radio and C-B operators helping them ring. Q-News
Graham Kemp, VK4BB, says a famous ham is trying to make it happen:

VK2DIK Dick Smith, is Chairman of the National Council for the Centenary of Federation, the still 14 months or so away.

VK2DIK plans to use CB and Amateur Radio operators for a project to ring church bells in relays right across the continent from Perth to Sydney.

It should take about two hours.

Everyone knows Dick Smith as an energetic, dynamo-like person with a clear idea of his targets and the paths he
needs to tread, to reach them.

This story in the Orange and District Radio Clubs newsletter came from their local Observer newspaper article by a
Mr. Graham Cooke and is the first that I, personally, have heard of Dick's plan to have the citizen radio and
amateurs share the ringing of celebratory bells for the Federation Centenary.

Nevertheless, when he engages with the WIA to organize for Australia's hams to help, I trust that each of us will
do our best for this historic occasion. After all, how often have CB-ers and radio hams ever been called-upon to
work together, let alone help coordinate the pulling of ropes to belt out tunes on bronze?

>Im Graham Kemp, VK4BB, of Q-News reporting for Newsline.

For those of you who have not yet made the connection, this is the same Dick Smith who brought his famous
Australian electronics chain to the United States over a decade ago.

**

CLOSE

With thanks to the ARRL, the F-C-C, the Hudson Loop, the Radio Society of Great Britain and Australia's Q-News,
thats all from the Amateur Radio Newsline. Our web page is at www dot a r newsline dot org and our e-mail
address is newsline at a r newsline dot org.

Before we go, we have an update on Newslines financial condition. According to Andy Jarema, N6TCQ, who is our
Support Fund Administer, Newsline has only received enough financial support to keep the service going though the
middle of December. In other words, the bills from October have been paid, but now money has to be raised to
keep from loosing the phones and e-mail service in as we pass into the new millennium.

Andy says that Newsline once again existing on a week to week basis. He says that once funds dry up, he pulls
the plug and Newsline will away. Its up to you the listeners to see that this does not happen. The address is the
Newsline Support Fund, Post Office Box 660937 in Arcadia California. The zipcode is 91066. Please help keep
Newsline on the air as we pass the threshold to Y-2-K and travel well beyond.

For now, with Bill Pasternak WA6ITF at our editor's desk, I'm Ken Butler, W1NNR hoping you had a Happy
Thanksgiving -- and we thank you for listening. Newsline is copyright 1999 and all rights are reserved.

Hey Prozac, Most of the winning amps are doing about the same numbers, There
is so much more to it than the amp. If you don't care to go to key downs you
really should keep your comments on them to your self, Dave mades are a
quality amp no two ways about it, but they are not the only thing going.
not to be rude, or insulting just like the keydowns and believe every one
who works there ass off on their vehicle has a fair chance of winning.

Hello Barry,

It could seem like a nice joke repeating all that "zeroes" trash that
guy posted (hopefully by mistake), but you did it on purpose, and
TWICE.
Isn't this a waste of bandwidth for us reading this newsgroup?
You could have done the same without all that garbage of zeroes,
simply writing <snip> instead of all that junk, and we would have
understood the same (and maybe liked it a little more).
The second time was a pure waste.
I hope you take this as a friendly guidance to netiqette.
cheers.

Thanks and best regards,
T-man

MC,

>Well, it was from my car, sorry that should be "moHbEEl" so that ought to be
>worth some handicap points. :->

Not with the power that some of you guy's run.

>> There are few, if any UK stations with the capabilities to cross the
>> pond on AM. I hope to change that.
>
>Having spent much time in the kingdom of UK, I think it is safe to say
>running a very high-powered AM station (particularly of the splatter-box
>variety) will quickly get you well known with her magesty's post office.

Now called the RA (Radio Communications Agency).

Our boys are currently under-staffed and under-manned. You would have to be a real nuisance or to have been reported on for causing interference to be busted. The FM broadcast band pirates are keeping them plenty busy in the big cities some running more power than the legal commercial stations!
>My question to you, Phil, is I gather UK CB radios run FM from about 27.4125
>to 27.9125, is that correct?
Yes, with a rip roaring 4w.
> Which channels/frequencies are most popular
>over there?
Probably 19. Legal operation has died a death so the 19 is used by both truckers and others mostly shouting obscenities at one another - just like in the US!
> For instnace, here channel 19 is always busy with truckers
>(lorry drivers). With this in mind, even when the band is wide open from
>here to there, I never hear any FM stations.
You won't. In 25+ years of operating I can count number of truckers who have got their technical act together on one hand. They may run a 100w watt heater into some kind of stupid base loaded or short Firestick antenna. About as good as talking to the truck up ahead.

Beams are not legally allowed so the few that are out there tend to be used by the illegal skip shooters and DX chasers.

Of course you're not going to hear these guy's on the legal 40. We now have a further 40 channels with the same mode and power sharing your FCC 40.
> And the stations I often talk
>to are running very basic equipment. Thoughts?
There are plenty of FM only operators who run a hundred or more watts into a 1/2 or 5/8 wave omni and who like to shoot skip. You should hear these on your east coast.
>MC
>
Many sideband operators either run Cobra 148's or more modern radios like Lincolns, 2830's etc. There are also a large number of jap ham ricebox users.

I went down that avenue over a 10-15 year period running the much rarer low power versions of rigs like Yaesu's FT301S and FT707S both running around 10w pep instead of the normal 10w. This allowed me to strap on a real when only low drive amp's were around.

More recently I've succumbed to collecting and using American military transceivers ie; Cubic, Harris, TWE etc. I have matching amp's as well.

They have just launched the Cobra 19 and 29 I believe but with our 80 channels of FM, only the Chinese left the mod transformer inside!!!

Phil / UK

Check your mail.

You got some this afternoon... About 4:00

Also, ask Paula how she is doing for me.

Thanks!

--Your new little friend.

depending on what kind of radio you have, and if it has had work done on
it, and what your surroundings are.(car,truck,base,etc.).....But i can

tell you one thing, Cobra mics are JUNK!!
...Maniac

Maybe their Power mic's but the only mic's I've known to produce some very exceptional audio quality is the 148/GrantXL mics. Like Andy said "... fidelity..." is definitely the keyword here. Every now and then you'd hear a Galaxy/Mirage/Northstar rig sounding really good with their stock mics but nothing as clear and as crisp as a 148/GrantXL mic.

Don't get me wrong. Not all Cobra/Uniden mic's are good. The stock mic's that come with the mobile/base rigs from the 142GTL / Washington on down have got some serious problems with AUDIO quality. Even the SoundTracker rigs suck. But wonders will occur when you re-pin a 148/GrantXL mic to any Cobra/Uniden rig and you'll see what I mean.

But then again, everyones got their own opinion...

137... back reading the NG!

jees that really hurts toll. Just asuming that it was me that did something.
You should be ashamed of yourself. Hey send them to my isp thou they are
totally untraceable. Like I told ya we are just starting off toll. We will
have some fun. Or I will anyways.

Jay, you cannot put the crystal in the cobra 148 they work of of a
phaselockloop system they don't use crystals like the older radios did
Changing the crystal that is in there would no doubt render the radio
inoperable at least on 27 mhz

The best mod to do to it is to put larger power wire on the input, as well as kill the stupid fuse block.

The next best thing to do is change the value of the resistor that supplies bias to one that will allow you to run a bit higher voltage. With slightly higher resistance, you can run 15 volts on that amp just fine, and it will give you mo power output.

Don't ask me what value of resistance because I have found each amp to be slightly different, as the value of beta of the transistors is different in every case.

However, you NEVER should have to go to 100 percent higher... In between the original value and about 75 percent is the biggest change I have had to make.

Also, the electrolytic on the 12 volt buss should be increased (voltage)... They have some marginally rated caps that need to be bigger when running more volts / watts.

Their are others, but if you don't know how to do them, I don't suggest trying to follow someone else's instructions. These that I gave you will help.

Took pride in their work...

Dick is no longer the controller of the company, and the current crop of
amps they put out show that.

However, I agree.... It is a nicely made amp, and can be retrofitted with
tubes that are more commonly available when you blow all three bottles!

Please don't, for you to use many times more power than the rest would ruin the band,why don't you understand this?If you need to communicate a longer distance get on a band that was meant for it.

Fujitsu used to make them.
```

Fujitsu rights where licensed to RCI (or one of Peng's contractors) and they have the line now.

However, the RCI branded chips don't seem to work as well as the older Fujitsu models.

They also made an MB8734, which was nearly unmodifiable (Pin 10 wasn't internally connected.)

When you power up George, you are supposed to hit "M1" 4 times and then
the "power" button. Try hitting "program" 4 times instead. Let me know
if this works. 73

No,

A real amp is cooled with water, and the only reason to have the blower is
to cool the equalizer resistors on the power supply.

Hey,

Just to FYI the group...

I did more testing on the RX problem I was having (with 153 making a perfect copyable signal on 26.085 or whatever..)

I have been unable to duplicate the problem with anyone else, leading me to believe that their was a problem with his transmitter. Hvae had it in the mobile for the last week, and has great ears, good transmit, and I really do like it!

Also, it picks up less hash type noise... The 148F would pick up the switching oscillator in my stereo amp at S5, but the James doesn't barely hear it.... And, the James picks up people I couldn't hear before.

Toll Free

Don't worry about it. I placed an order from him last month and didn't get a reply for a couple of days either. LIke you I got overly anxous and posted about him too. I got my amp a couple of days later though, and he even matched Exports R Us's price to boot. Look at the sites hits. He has got to be doing some MAJOR business. Relax, you'll be treated good.

Hello group,
Long time lurker here and I feel the need to respond to this post.I
being the proud owner of the cross breed mirage rci 2950 have found this
radio to be one of the best radios for the money out there.
I have also experianced most of the small problems you guys post about
this radio such as the vairiables in tempeture,over mod ,because of q32
do not ever remove this.the radio itself has more mod than you need
without that kind of buthery.the main problem that I have found is the
stock power wire that comes with the radio. change this out with thicker
wire and youll see a lot of your problems dissapear.
thank you,
843 HOMEGROWN RADIO N,J

Greetings!

Yeah, I know. It's not hard to understand the concept, it's hard to describe it.

To break it down, Conjugate match is much like what you've added.

Using coax, with it's own responses to the antennas non-resonate impedance, can offer a means to oppose the non-resonate antenna to make the system appear resonate.

The hardest part to convince them of this is.

When the antenna is made resonate, before leaving the factory, using a specific length of coax. The antenna *needs* the specific length in order to show any sort of tunable SWR.

It is up to the operator then, to mount the antenna in a way that makes the antenna resonate without having to use a specific length of coax.

It can be done in a variety of ways.

Antenna makers have gone a long way in realizing this. So, they make antennas work in most installations. It's the extremes that get people all riled up.

Some Ham operators don't realize that ground image plays an important role in how the antenna can, or can't, decouple itself from the feedline.

It's funny to sit back and watch. I don't like trolling, but this stuff [coax length] gets some people all worked up.

Thanks for letting me know about "over".

Greetings!

While Dancing with the Mouse on Wed, 01 Dec 1999 11:52:01 GMT, the
Modem interrupted with an MNI from "nasto@ath.forthnet.gr
(<<<Corssair>>>)", and the MotherBoard buffered this to Video RAM:

:+> 100% correct. The only solution for minimum SWR is matching of
:+> transmition line and aerial. Matcher should be placed between them.
:+> Prozac's mfj-259B suggestion mactches exactly the case for solving
:+> such problems !!!

Is this a plug or what?

A Transmatch...

Regards!

```

The usual sequence of button presses won't work on this new model. It's
stuck on 40 channel FM. Any info on enabling other modes and bands would be
appreciated.
Chris

GToyama wrote:

> I have a mag-mount with stainless whip. 2 questions:
> 1) does SWR change if antenna is transferred between vehicles?

SWR is affected by the location of the antenna on the vehicle in relation to other metal, roof top, etc. SWR can change if you are parked and open a door, or someone is standing nearby. An antenna which appears flat on one vehicle might be quite high on another. Adjust the antenna to the vehicle you will most commonly use it on and if you must change it over, find a location on the second vehicle which shows the lowest swr without making adjustments. Much easier to just buy a second antenna and plumb it into the car properly rather than always have a temporary setup.

> 2) for a given vehicle/antenna combo, does SWR change if a different radio is
> used?

If the radio shows 50 +/- ohms impedance as it should, any radio should interface. You don't need a radio connected to check and adjust SWR.

I believe that the Titan is not the same as the HTX-10 or the 4900, the size and the layout of the face is close but the internals are different. The Titan 485 has the plus / minus 5 kHz button same as the Sidewinder 400. The HTX and the 4900 can be tuned in smaller increments. Now the Titan handheld is better and like the Spitfire can be tuned in smaller increments. As for swapping out the CPU to gain features, that might be possible but most likely not worth the effort. This "new" series of radios, the Cherokee, Eagle, Titan, Albrecht, 4900 and others are all made in Korea with a Sanyo CPU. Not high quality but good bang for the buck. Given time they should improve, (and are!) and five or ten years down the road they may be looked at with fond memories like the 2510 and some of the "good old" Cobras!

Well if you were involved & bought a new tractor or truck you would get a owners manual from Jacobs Engine Co. In the manual it tells you to use it in both moderate & heavy traffic! In fact it tell you to turn it on when you leave your yard & leave it on at ALL times to allow it to releave the stress on the brake system. Even many fire dept. have them & at 3:00 am they use them around my house when slowing for a curve. I just want to clear up the misconception that they were only designed to be used on rual mountians. The manufacture of them puts the information in their manuals to use them at the places that you are complaining about...

While it's not considered "courteous" to run your jake in the city, a good case can be made arguing it's benefits. I have to draw the line though at running through the truck stop parking lot at 2:00 AM with the jake on. With the introduction of the "Super 10" transmission, many drivers developed the habit of using the jake in it's lowest setting to help in shifting through the button shift gears. In my opinion, this is only a benefit when upshifting on a climbing grade.

>They are also known for releasing the air from the brake systems when
>trying to "hurry" people along at crosswalks.

This is just an assumption on your part. The driver has no control over when the _automatic_ air drier blows out moisture from the air system. That is most likely what you hearing. The only other way to release air from the system is by popping the brake valves. Doing this sets the spring brakes on either the trailer, the tractor or both. This releases all of the air from the brake systems. In order to move again, the system needs to be recharged with air because the lack of air pressure causes very powerful springs in the brake drums to engage the brake shoes against the drums. It's a safety system. While it takes only a couple moments to recharge, it's a hassle because you can't move until the springs release. A driver in a hurry would never do this. Releasing pressure on the brake pedal will cause an small amount of air to escape the brakes. Hard to say that this is intentional. Your foot moves on the brake. It takes less pressure on the pedal to hold the truck at a stop than it does to actually stop it. Just like your car.

>I think truckers are quite
>courteous most of the time on the road, but when the weather is crappy a lot of
>'em take bad risks and put 4 wheelers into dangerous positions. Where I live,
>there have been a rash of tipped trailers and flying truck wheels lately.

You ought to see the dangerous positions that four wheelers put trucks in every day from the driver's seat of a big truck. I guarantee you it would change your attitude about trucks forever. People drive around them like they are just cars that can stop on a dime. Sometimes trucks are rolled over due to inexperienced drivers in bad situations. Often times, it's the result of the truck turning hard to avoid killing a family who just did something awfully stupid in front of them.

Accidents happen. This entire country lives and dies by the truck. Without them, you have nothing. There's a lot of them out on the roads, each logging approximately 130,000 miles a year. Some more, some less. The average car drives 12,000 to 20,000 miles a year, yet is involved in many more accidents than the average truck is. It's because of professional drivers that this accident rate isn't incredibly higher. Give 'em a brake. They are out there laying their life on the line everyday so that you can have everything that you have. All for about $30,000 a year, before expenses.

If you touched it, a trucker brought it...

I have 3 Grant XL's and 2 of them have been tuned to work with Astatic 575-M6
mics and sound just awsome and the other one has the stock mic but had the
modulation cranked up and sounds just like a stock grant XL with a power mic.
The Grant/148 stock mics sound way better than any stock mic ever made.

A typical maximum useful range for 4W handheld CB is between 1 to 5 miles depending on many factors (weather, transmission frequency, open space vs crowded buildings, length of antenna etc.).

Frog@mageos.com wrote:

The only UHF amp for FRS that I`ve seen is manufactured by RMS International.Output power is rated at 3 to 7 watt at 430-460 mhz. Has receive preamp also.

Miles,
Sadly, if it wasn't so damn true, I might be offended by that statement. But you're so right on that it's sad (not that you're right but that it's true, mind ya). I haven't fired up any of my ham gear in the past 3 years becase of bozos like those racist assholes "B.A.R.F." and the dumbasses that unlawfuly jam them. Hell, up here we've got some deranged old coot that holds nets on a local repeater 24-7.. problem is, nobody else is part of his imaginary net. It's sad. Really really sad.

The art (and at one time it was an art.) of amater radio is dying, and
thanks to the likes of those down on 80m/75m, it won't be long before
Motorola comes along with a impressive amount of $$$, and buys up the bands
from us....11 meter too.

Have for sale 1 cobra 148GTL in good condition,works great, has been tuned-up,will sell for $120 as is, or will modify to your liking.Also have a Silver Eagle Desk mic, good condition,works great,it's currently wired for a 5-pin cobra/uniden, but will wire to your liking if i have plug you need.

ps-almost forgot, i also have to r.beep boards FS...one is a workman brand 5-tone r.beep,and the other is k&b 2-tone,both not botched up,work fine,look fine...best offer(s)

73's

> For now we are both very pleased.
> The purpose for the original post was because we have noticed during our last 3 contacts that as the sun goes down here in PA I don't put out or receive near as much skip traffic. When the sun is up the skip is occasionally unbearable.

Skip is the only thing letting you talk,your 100 watts and his 3-400(when he gets it)won't do the job on this band,your at the mercy of the ionosphere.

An 11 meter system to do what you want would cost so much and attract so much unwanted attention that the idea is foolish.

Reliability can only come with lower freqs....MHZs lower.

It will have to be done at the antenna to make a noticeable improvement,trucks are all I drive but lets face it,there is no such thing as a good-lookin pickup....drill a hole in the rear bumper and install a full size 1/4 wave whip.

Folks -

Does anyone out here know PLL details about a basic
HyGain I AM rig, model #2701? The rig is 40ch unit,
gonna be a Cybernet chassis.

Since it's 40ch, it's gotta be synthesized (I know it's
a PLL02A chip). Does any RKI know if this is a 3 xtal
(w/mixer offset osc.) or a newer 2-xtal job?

One clue would be if the 2701' PCB# is PTBM03nAOX,
where n=3,6,9 (mabye even 1). These guys have the
3rd xtal for mixer offset.   If it's a PTBM04mAOX
where m=6 or 8 then it's gonna be a newer 2-xtal
architecture not suited for my needs. ;-)

Thanks!
-Bill

The first thing I did was bookmark it! Fantastic site! I had the pleasure of
doing business with 2 factory authorized Browning dealers in the '70 's, in
South Jersey. Karl Stein of Egg Harbor, NJ, and Bill Clarke of merchantville.
My everyday radio is a modified Mk.1. The transmitter has a 6L6 inplace of the
6BQ5, and a 2E26 in place of the 5763. The receiver has the 31.1 and 31.7 mhz.
xtals along with the 40 channel dial. The cosmetic appearance is a 5+, but she
walks 'n talks! This is the way the radio was when I bought it 15 years ago.
You ain't got a thing, if you ain't got that PING!  73, Crazy Bob KGM-4216
EC-3071 KF2IB.

I recently bought an antenna that is supposed to create its own ground plane. It's a fiberglass antenna, but has a round plastic piece attached near the bottom, and the cable screws into it. There are no wires going from that piece to the wire wrapped around the antenna. How does this antenna work? It does work pretty well.

Thanks,
John

You didn't say if it was a hard wired phone or cordless. For starters,

use a radio that is legal and if it continues to be a problem, then the
monkey is on her back, not yours.

Turning the squelch up has nothing to do with the range of your
transmitted signal. With dual antennas at the corners of the cab, the
signal is most potent from side to side, not front to back. Try
adjusting the length somewhat for a lower swr if possible or use a
single antenna, mounted in a more central location.

I dunno 'bout where you live, but where I am many truckers will use their jake brake in built up areas - especially when decelerating behind a stopped car at a light. They are also known for releasing the air from the brake systems when trying to "hurry" people along at crosswalks. I think truckers are quite courteous most of the time on the road, but when the weather is crappy a lot of 'em take bad risks and put 4 wheelers into dangerous positions. Where I live, there have been a rash of tipped trailers and flying truck wheels lately.

I have a 2510 that a neighbor 7 houses down that destroyed it. Switched over to my Drake R4B and could barely here him. He was on Channel 3 and I was on Channel 17.

Most CB rigs that use bipolar transistors in the RF amp stage are very susceptable to overload.

Every 5 pin RS microphone ever made....

Pin	
1	shield of mic audio line (ground)
2	grounds out mic audio input when in Rx (blue)
3	PTT line. This is switched to ground (pin1) when key pressed(red)
4	mic audio line. inside shield (wht)
5	receive enable line. this switched to ground when key released (blk)

Not all RS radios make use of all 5 pins - but most do. All the microphones are the same.

Be sure to check out my Realistic Pre-Amp Mic Modifications I posted a week or so ago on this group.

Exactly right! Perhaps he meant that he could not HEAR very far.....

>With dual antennas at the corners of the cab, the
>signal is most potent from side to side, not front to back.

I'm puzzled. I've never used the co-phased antenna arrangement, but I thought the purpose was to "beam" the signal toward the front and rear so you can communicate better up and down the highway. Although the cab is gonna block the forward signal somewhat, I suppose.

>or use a
>single antenna, mounted in a more central location.
>
>

I think that's a very good suggestion, Gary. Unless he runs up and down the Interstate highways, a more omni-directional antenna arrangement will be better.

Here's another thought....if I remember my antenna theory right, the two antennas have to be a certain physical distance apart to form an effective directional array. His poor receive might be due to having them too close together, such as would be the case on a pick-up truck's side rails. I notice that the big trucks mount them out on the mirrors. I suspect there is a reason for that--to get the proper distance.

Now, for iskee (the self-proclaimed "newbie"):
Glad you brought this question to the group. Hope the info you get is helpful.

Here's a simple analogy concerning any kind of directional antenna:

Compare it with a flashlight bulb. Hanging in free space, the light scatters in all directions and quickly disappears. Installed in a reflecting mechanism, the light is "beamed" in one direction and is much stronger. However, in other directions, the light is more dim (or GONE).

The power is the same. It simply was concentrated in one direction. This is how antennas work. A simple ground plane or mobile whip is like the bulb hanging in free space. However, various kinds of antennas have been developed to concentrate the energy to accomplish a specific purpose. For example:

A multi-element array will send the energy in the direction of the antenna's beam. That's great for a base station where the operator wants to send the signal in a specific direction, but it would not be practical if you want to transmit and receive from all directions.

In that case, you can put up what is known as a 5/8-wave antenna, which will still radiate in all directions at once, but the energy which normally goes up at a high angle is now concentrated toward the horizon--giving improved signals.

A 5/8-wave antenna is quite long, physically, and thus is not practical for a vehicle. Typically, we use a quarter-wave antenna on a car or truck, but it seldom can be put in the center of the vehicle and thus ends up transmitting better in some directions and worse in others. One solution is to use a base-loaded whip (Wilson 1000, or K-40, for example) to allow a shorter whip which can be mounted in a more ideal location (like say, the center of the roof). This gives more consistent radiation in all directions with only a small sacrifice in gain.

SUMMARY: Choose the antenna type by what you wish to accomplish. Co-phased arrays are highly directional and probably are counter-productive in a passenger vehicle being operated around town. But, to a over-the-road trucker interested in keeping up with his fellow drivers or knowing what's happening way ahead of his rig, they are ideal.

Best wishes,
QRM

In this case it is a fair bet. If you make the fundamental of the crystal the same as the operating frequency you can turf out a lot of components. I believe it is more likely that the unit is operating on 11A than 24. As for modifying it for voice, possible but there is no point.

Have Q32 put back in. When the hacker tuned your radio, he removed or clipped

this transistor wich disabled your ssb power control. Replace it and you should be fine.

Do the big rigs up north keep their engines running all winter long?
I heard that they did this because if they shut them off, the engine
would get to cold and it would be more of a hassle to get it started
then to just leave it running and pay the fuel bill.

I don't understand why people must insist on putting thier two cents into a subject if they don't have a answer for the question.

I think the better way to go about things is maybe ask the person that made the post if they have a idea on why the choke burned up.
The answer is this simple, The person that had the amp before me over drove the amp and burned the choke on the input side of the amp....
I hope we took the guess work out of all your posts.
I respect all of the people the try to help but to the people that offered no help and think that they are better then everyone else, The old saying go's like this. If you have nothing nice to say, Don't say anything at all..
Thank you for your time.   We back out.

Cross country drivers leave em running allot because they need the heat to
sleep in the sleeper berths.
Many drivers have gone back to the good old days type living like a gypsy,
in the truck instead of a motel.
 Truckstops have for the most part very nice shower facilities so allot of
drivers sleep in the truck and shower at the truckstops when they stop for
dinner, fuel etc..
  With todays technology its easier to start a truck than it was a few years
ago with fuel preheaters and such, but the seriously hard winter weather can
still wreak havoc on the fuel system of a large car.
I've never heard of leavin em run all winter though.

Dillo

Is this a decent radio for AM operation? I had owned a RG-99, but after talking on it for a while, it would heat up and start to squeal. Any other suggestions for a good mobile radio..I use a Predator 10K antenna, 213 coax, and the mount is grounded to the truck frame..Thank you for your advice.

I got an offer today on an Emporer TS-5010 for $100.00. It is in really great shape and works tried it out today. It's an amature ham radio. But as most of you allready know I know nothing about cb's etc. So is this worth what the person wants for it? Also I heard there is one called and Allan something that is almost identicle? Which one is better. I have tried looking at different sites for this radio but cant find it anywheres. I was wondering also what the price for a new one would cost and if so is there a place on the internet to get one?
Thanks....

Do I really need more from a 2970 than 100 plus watts?
At 4:30 PM EST I spent a little more than 25 minutes talking to little brother on 26.855 am. We both had crystal clear copies on each other except for three times when a monster station stepped between us.
I am pleased but little bro is talkin about puttin 3 or 400 watts behind his 2950 in the big purple Peterbilt with twin Wilson 2000 truckers. Right now he is running the 50 at the way it works after being peaked and clipped but is going to get a few other minor mods done.
This ought to make somebody's skin crawl........he's gonna put an echo box in the 2950 so it will sound better and I think it'll be after the first of the year but I think I will be putting one in my 2970.
For now we are both very pleased.
The purpose for the original post was because we have noticed during our last 3 contacts that as the sun goes down here in PA I don't put out or receive near as much skip traffic. When the sun is up the skip is occasionally unbearable.

Thanks gang,
Dillo

the ssb power is not going to change with the power control it is taking the power from a different circuit then AM. SSB uses power to get modulation out of the radio you could turn it down inside the radio but I wouldn't mess with it they are set to work the way they are set up.

Here is the allan 9001 that i was reffering to. You can see a pic of it here. http://www.copper.com/online/box.cgi?name=E00-00000&add=Add+To+Order
It is almost identicle to that. If not exacty the same cant remember. But from what that one is priced at sounds like a good deal to me. But my luck it isnt lol.

Glad to hear from ya. I'm sure that Abe would be overjoyed to hear that
others are copying his work nowadays, but i can't agree by any means that
those amps are copies. Sure, the transformers may look similar, but that's
where it ends. The performance and power outputs verify that. Sean

Yes, removing Q 32 does disable the ability to vary your SSB power output via the RF power output knob on the front of the radio. To get around this, simply adjust your mic gain accordingly. Since SSB is strictly audio driven, reducing your mic gain will also reduce your power output.

As to experiencing radio failure due to the removal of Q 32, i sincerely doubt that. There MUST have been other improper mods done to the radios to cause premature failure. I have yet to have one radio ever come in that suffered problems from someone doing that. Sean
>

Hoosierbackups wrote in message ...
Yes butchers like to remove Q32 and it disables the SSB variable power.Same thing on 2990,2970,lets the SSB run wide open.Makes the radio sound like crap on SSB and causes for a very short life.99% of the Galaxy and RCI radios I get into the shop with SSB problems is because the ALC is disabled.There is a correct transistor to remove that has no affect on the SSB output.

He meant that the factory power cord that comes with the radio is insufficient. After modification, the radio is pulling a greater amount of power and the power cord can become the limiting factor.

If your display lights dim drastically when keying and modulating, your voltage is dropping due to the radio starving for power. By replacing the factory 16 gauge power cord with a heavier wire (MAKE SURE IT IS STILL PROPERLY FUSED), you may see greater power output, higher modulation levels and better frequency stability on SSB. Hope this helps. Sean

This typically occurs due to overdrive. Most people think that this amp

will survive with a 10+ watt carrier level being fed into it. They are
mistaken. I might have one that is in for repair, but not sure. I'll take
a look and see what i can come up with. Sean

I need help from the Newsgroup...

I have a LA 900 moblie amp that burned up a choke that is right off the
input
pad inside. It is a coiled and molded choke red in color with a white dot
on
it.
Can anyone help me find out the value of this choke, or point me in the
direction of the amp builder ? This is a nice amp and would love to get it
working again.

Thanks in advance

Hi there. I am new to this group so forgive my ignorance on some of these subjects. I have a c.b. in my daily driver, (89 f-150 truck) it is a Uniden weather max I believe. I drive about 60 miles every day on the highway. Is there a way to boost the transmitt and receive capabilities of this radio by doing something internally to it? I am not wanting to talk 100 miles away to someone else just boost the performance slightly.

And I know all of you are going to laugh at me on this one but the antenna I use is the cellular look alike on the window. I know this is not optimal for performance but do not want to mount a huge antenna to my truck. The other thing is that I plan on intalling a bedcover and this cuts down mounting options extensively.

Right now I only have line of sight capabilities, meaning I can usually talk to truckers if I can see them. Any suggestions on improving this would be greatly appreciated!

Toll's suggestions are all valid, depending on how far you want to get into it. For most applications, just changing the power wires and bypassing the factory fusheholders will show a measurable increase in performance on the Texas product line. I do recommend running an in-line fuse, but this should be mounted as close as possible to the power source (battery).

From my experience, here is a basic guide as to what gauge wire should be used with the various amplifiers. Keep in mind that these are for relatively short lengths of wire (appr. 10' - 12'). They are the MINIMUM allowable to obtain maximum performance from the amplifier. Longer runs should go to the next heavier gauge to minimize voltage drop. Amplifiers with bias (Texas Star) will pull more current than "competition amps" with no bias (Dave Made, Pirate, X-Force, etc). Amplifiers that are being driven harder via built in drivers or an external driver amp will also pull more current. They should use the next heavier gauge wire down the list. Take this into account when selecting the proper wire for your installation.

ALWAYS place some type of fuse / breaker at the power source to protect the vehicle from an electrical fire. Under competition conditions, if your worried about the fuse possibly current limiting the system, use a slightly bigger fuse than necessary. This will still blow should a direct short to ground occur and may save your vehicle from becoming a rolling flame thrower or even your own death-trap.

How much is you or your families safety worth ???? I know people that have completely lost their vehicles due to fires started from poor radio / amplifier installations. I had also specifically warned another local about his poor installation, yet he didn't correct it. He did end up having a car fire because of it. The scary thing is that his kids were strapped in the back seat in child seats and he couldn't get them out of the car very quickly. Luckily, nobody was hurt.   Things like this DO occur, so don't be dumb or cheap. (Sorry to rant so much, but this is VERY important.)

2 pill (1446's, 455's, etc) = 10 gauge

2 pill (2290's, 2879's , various Motorola's) = 8 gauge

4 pill (1446's, 455's) = 8 gauge

4 pill (2290's, 2879's, various Motorola's) = 6 gauge (4 would be better)

6 pill (2879's, etc) = 4 gauge

8 pill (2879's, etc) = 2 gauge

10 or 12 pill (2879's, etc) = 0 gauge

16 pill + (2879's, etc) = Double 0

Also keep this in mind when looking to purchase amps. If the wire gauge coming out of them is measurably smaller than what is specified here, the manufacturer is cutting corners and costs. Where else are they saving money at INSIDE the box ??? Hope this helps and be safe out there :) Sean

Toll Free wrote in message ...
The best mod to do to it is to put larger power wire on the input, as well as kill the stupid fuse block.

The next best thing to do is change the value of the resistor that supplies bias to one that will allow you to run a bit higher voltage. With slightly higher resistance, you can run 15 volts on that amp just fine, and it will give you mo power output.

Don't ask me what value of resistance because I have found each amp to be slightly different, as the value of beta of the transistors is different in every case.

However, you NEVER should have to go to 100 percent higher... In between the original value and about 75 percent is the biggest change I have had to make.

Also, the electrolytic on the 12 volt buss should be increased (voltage)... They have some marginally rated caps that need to be bigger when running more volts / watts.

Their are others, but if you don't know how to do them, I don't suggest trying to follow someone else's instructions. These that I gave you will help.

Ignition Noise - bruit d'allumage

Lorsque le moteur de ma voiture tourne (une Dodge Caravan 1999), je constate qu�il g�n�re des parasites qui brouillent la r�ception de mon �metteur-r�cepteur radio-amateur (Icom IC-706). La r�ception de la radio AM-FM est �galement tr�s affect�e. Le probl�me se pr�sente de la fa�on suivante : lorsque le moteur est �teint (la clef sur � accessoires �), je syntonise une station �loign�e dont les signaux sont faibles mais clairement audibles. D�s que je d�marre le moteur, je perds la r�ception du signal. Le bruit d�allumage g�n�r� par le moteur est audible avec un fort signal sur tout le spectre couvert par ces deux r�cepteurs. En d�modulation AM, j�entends tr�s clairement le bruit du moteur dans le bruit de fond; le bruit d�allumage d�modul� � sortant � du haut-parleur varie avec la vitesse (RPM) du moteur, et ce sur les deux r�cepteurs en question. Sur mon r�cepteur amateur, j�ai un indicateur de l�intensit� du signal re�u (s-m�tre), qui monte pratiquement � la moiti� de son �chelle lorsque le moteur tourne. Lors de l��coute de cassettes, le probl�me n�est pas pr�sent. En bon technicien que je suis, j�ai tent� d�investiguer la source du probl�me par moi-m�me.

J�ai d�abord suppos� que le bruit atteignait mes r�cepteurs radio (auto et radio-amateur) via l�alimentation 12 V. DC. Pour m�en assurer, j�ai branch� tour � tour ces deux r�cepteurs sur une seconde batterie � ind�pendante � (une gel-cel), donc compl�tement isol�e du reste du circuit. Malgr� cela, le probl�me est toujours pr�sent, et ne diminue pas d�une miette! L�interf�rence ne provient donc pas du circuit d�alimentation, et il serait donc inutile d�ajouter une filtration (genre choke R-L) sur le 12 volts DC.

Lorsque je d�branche l�antenne (autant sur le AM-FM que sur la radio-amateur) alors que le moteur tourne, le bruit dispara�t. Si j��loigne l�antenne du v�hicule en la laissant branch�e au r�cepteur, le bruit diminue progressivement. J�ai aussi constat�, lors de mes essais, que je brouille aussi les r�cepteurs des v�hicules gar�s � c�t� du mien�!

Voici les lectures du niveau de bruit prises � diff�rentes fr�quences, avec mes antennes habituelles; on constate que le niveau de bruit d�allumage est encore tr�s �lev� � une fr�quence radio aussi �lev�e que 446 MHz :

fr�quence	antenne	radio	lecture
31.000 MHz AM	fouet � onde	Icom IC-706	8 (sur 60)
144.100 MHz AM	fouet � onde	Icom IC-706	7 (sur 60)
446.100 MHz AM	fouet � onde	Icom IC-706	5 (sur 60)

640 KHz AM	fouet Chrysler	AM-FM Chrysler	bruit tr�s �lev�
92.9 MHz FM	fouet Chrysler	AM-FM Chrysler	perte de sensibilit�

J�en arrive donc � la conclusion que l�interf�rence (le bruit) est irradi�, c�est � dire que le moteur �met des ondes radios dont les harmoniques s��tendent jusqu�� 500 MHz (fr�quence la plus haute sur laquelle je suis brouill�), et qui � enterrent � donc les signaux radio faibles quelques m�tres autour du v�hicule. J�en arrive � cette conclusion pour trois raisons : 1- une batterie isol�e ne diminue pas le probl�me. 2- D�brancher l�antenne fait dispara�tre le probl�me 3- la cassette n�est pas affect�e.

J�ai fait une petite visite chez mon concessionnaire Chrysler, �tant donn� que le v�hicule est neuf et garanti. Apr�s avoir inspect� le moteur, ils n�ont rien trouv�. Le c�blage des bougies et ces derni�res sont de type r�sistifs, install�s de s�rie, donc un point d��limin�. L�ordinateur de bord est d�j� prot�g� contre les � EMI � (electromagnetic interference) dans sa conception, selon les ing�nieurs de Chrysler. Les mises � la terre des diff�rentes pi�ces du moteur sont d�j� bien faites lors de la fabrication.

Je me suis fabriqu� une petite antenne (dip�le de 4 pouces de longueur) au bout d�un long c�ble coaxial branch� � mon r�cepteur radio, et je me suis promen� autour du v�hicule en �coutant l�interf�rence re�ue, afin de localiser plus pr�cis�ment la source de bruit radio. C�est en approchant l�antenne du circuit d�allumage (cap distributeur, c�bles de bougies, bougies, coil) que je capte le maximum de bruit. En fait, l�augmentation y est radicale. On m�avait sugg�r� que la source de bruit pouvait �tre la pompe � essence, mais en y approchant la petite antenne je ne re�ois aucun bruit. J�ai tent� aussi de d�brancher l�alternateur; le probl�me reste pr�sent.

Existe t�il des dispositifs de filtration qui peuvent �tre install�s sur le circuit d�allumage? J�imagine que d�autres amateurs ont v�cu le m�me type de probl�me avec leur voiture; y ont-ils apport� des solutions? Une recherche dans les newsgroups sur internet n�a rien r�v�l� de pertinent pour ce type de probl�me. J�ai aussi consult� la litt�rature radio-amateur (Radio Interference handbook) sur le sujet, et tout ce qu�ils sugg�rent comme piste a d�j� �t� tent�, sans r�sultat. Si vous avez une id�e pour mon probl�me, vos suggestions seront tr�s appr�ci�es.

You are right on 1 count, counsel. I meant "cops" as in plural. But since my "s" key did not take, I graciously admit defeat on this specific issue due to my own error of not carefully rereading my post before sending.

I stand by my post that "most" readers on this NG are quite aware of the law. As you pointed out, Jason MAY not be one of them, but for the most part, I do believe the posts are usually semi-literate:).

The "listening but not talking" is indeed a valid alibi, as we are innocent until proven guilty. So unless Jason states he is not a ticket holder or is caught transmitting on an unauthorized freq., it most certainly does wash. Anyways, motion withdrawn.

Greetings!

If you're talking about "Up north" as in a yooper' [ya'!] - yes.

There are problems with jelling of diesel fuel when exposed to high humidity and freezing conditions.

There are also a lot of problems with gas-engine vehicles too. Many Canadian dealers, as well as the upper midwest - offer engine block heaters to handle the extreme cold. In fact, you can get it from the factory that way.

You plug it in overnight, just remember to unplug before you leave.

While Dancing with the Mouse on Thu, 02 Dec 1999 04:26:03 GMT, the Modem interrupted with an MNI from "explorer@voyager.org (John Jenkins)", and the MotherBoard buffered this to Video RAM:

Greetings!

The antenna is a 1/2 wave wound - all those coil turns make the antenna appear as a 1/2 wave.

The round part on the bottom, is a toroid. It too has coils wrapped around it.

The part helps provide a low SWR for you, all you have to do is connect it.

One hint, may not work well on a vehicle with a lot of metal. It's better to use a regular CB antenna instead. A regular CB antenna uses metal, the antenna you have, performs better if you don't mount it to, or use it around, any metal. Can cause problems with matching it in [SWR] and working.

The antenna performs poorly compared to a regular CB antenna, but at least you have an antenna which is better than nothing at all.

While Dancing with the Mouse on Thu, 02 Dec 1999 10:04:49 GMT, the
Modem interrupted with an MNI from "Johnny B <nysteak@my-deja.com>",
and the MotherBoard buffered this to Video RAM:

Try these news groups alt.radio.scanner and rec..radio.scanner. The new Uniden scanner 245 xlt is a trunker and is getting good reviews. I have a 235 and it performs well but could use some more power on the volume. Radio Shack new trunker is getting good reports too. But you should check and see what is being used. No one in my area is using a trunked system yet so the extra money was a waste so far.

New scanners cannot be modded for cellular so don't fret about it. Most are going digital and you won't be able to pick them up anyway.

try www.bills2way.com he has some good prices or ask on the NG mentioned above. They will point you to some good sources.

You must be a linear amplifier expert. :^) Tell us more.

Sean wrote in message ...
:Toll's suggestions are all valid, depending on how far you want to get into
:it. For most applications, just changing the power wires and bypassing the
:factory fusheholders will show a measurable increase in performance on the
:Texas product line. I do recommend running an in-line fuse, but this
should
:be mounted as close as possible to the power source (battery).
:
:From my experience, here is a basic guide as to what gauge wire should be
:used with the various amplifiers. Keep in mind that these are for
:relatively short lengths of wire (appr. 10' - 12'). They are the MINIMUM
:allowable to obtain maximum performance from the amplifier. Longer runs
:should go to the next heavier gauge to minimize voltage drop. Amplifiers
:with bias (Texas Star) will pull more current than "competition amps"
with
:no bias (Dave Made, Pirate, X-Force, etc). Amplifiers that are being
:driven harder via built in drivers or an external driver amp will also pull
:more current. They should use the next heavier gauge wire down the list.
:Take this into account when selecting the proper wire for your
installation.
:
:ALWAYS place some type of fuse / breaker at the power source to protect the
:vehicle from an electrical fire. Under competition conditions, if your
:worried about the fuse possibly current limiting the system, use a slightly
:bigger fuse than necessary. This will still blow should a direct short to
:ground occur and may save your vehicle from becoming a rolling flame
thrower
:or even your own death-trap.
:
:How much is you or your families safety worth ???? I know people that have
:completely lost their vehicles due to fires started from poor radio /
:amplifier installations. I had also specifically warned another local
about
:his poor installation, yet he didn't correct it. He did end up having a
:car fire because of it. The scary thing is that his kids were strapped in
:the back seat in child seats and he couldn't get them out of the car very
:quickly. Luckily, nobody was hurt.   Things like this DO occur, so don't
be
:dumb or cheap. (Sorry to rant so much, but this is VERY important.)
:
:2 pill (1446's, 455's, etc) = 10 gauge
:
:2 pill (2290's, 2879's , various Motorola's) = 8 gauge
:

:4 pill (1446's, 455's) = 8 gauge
:
:4 pill (2290's, 2879's, various Motorola's) = 6 gauge (4 would be
better)
:
:6 pill (2879's, etc) = 4 gauge
:
:8 pill (2879's, etc) = 2 gauge
:
:10 or 12 pill (2879's, etc) = 0 gauge
:
:16 pill + (2879's, etc) = Double 0
:
:Also keep this in mind when looking to purchase amps. If the wire gauge
:coming out of them is measurably smaller than what is specified here, the
:manufacturer is cutting corners and costs. Where else are they saving
money
:at INSIDE the box ??? Hope this helps and be safe out there   :)   Sean
:>
:
:
:
:
:Toll Free wrote in message ...
:The best mod to do to it is to put larger power wire on the input, as well
:as kill the stupid fuse block.
:
:The next best thing to do is change the value of the resistor that supplies
:bias to one that will allow you to run a bit higher voltage. With slightly
:higher resistance, you can run 15 volts on that amp just fine, and it will
:give you mo power output.
:
:Don't ask me what value of resistance because I have found each amp to be
:slightly different, as the value of beta of the transistors is different in
:every case.
:
:However, you NEVER should have to go to 100 percent higher... In between
:the original value and about 75 percent is the biggest change I have had to
:make.
:
:Also, the electrolytic on the 12 volt buss should be increased (voltage)...
:They have some marginally rated caps that need to be bigger when running
:more volts / watts.
:
:Their are others, but if you don't know how to do them, I don't suggest
:trying to follow someone else's instructions. These that I gave you will
:help.

I agree that the majority of shops are VERY crooked. You would not believe how much work i get out of the shops in that area. I recently had a guy come in that paid over $180 to have two 2879's put into his Texas 350. At that rate, i could retire pretty quickly.

I should start taking digital photo's of what some of these radios look like when they come in. I've got the digital camera and a BIG scanner, too bad i'm not "puter literate" !!!! Sean

This must be the CB Shop that I heard a truck driver last weekend speaking
of.
I was going through West Memphis, Ark. fixing to cross the river into
Memphis,
Tenn. Then I heard a driver telling another driver that he hooked his radio
up
backwards.  He took it to the shop by the truck stop and the manb charged
him
250.00 to replace a small part.  These are the shops that give the good
shops
bad names.

What you know Joe?....... Nothing........

I didn't post that last little tid bit, you must have felt guilty about something.

Well, since you know all about me
and feel justified in posting personally
targeted obscenities to me in public
newsgroups, how about telling
me your name and address? Or are you
afraid to even the playing field?

What's even, slumming around your part of
town? I know not......... Think again
little wonder.

I thought so. Just another coward
who throws rocks and then runs
away and hides.

Not even, if I thought you could afford
the bus ticket up to the San Francisco
Bay Area, I would tell you exactly where
to find me. Since you don't have a tax
exempt status for me to donate you a
ticket, forget it, I can't get a write
off, what good are you?

Sleep tight, hope the cockroaches bite,

I like these radios overall, but they do suffer from inconsistent soldering and smaller "lands" than on other boards. This leaves less solder material to make contact and the greater potential for bad joints due to vibration. I am still working out various mods on these radios, as i don't get much time to experiment too often.

Overall, these radios do more power than the current Galaxy models with dual finals. They use a different digital echo than the 73's or 99's. I prefer the standard analogue echo for best tonality, with the digital echo from the 73's / 99's next and then the digital Ranger echo. The receivers are typically pretty KILLER in terms of sensitivity. If it's quiet out, they will hear things that only the early 858 SSB chassis could have picked up. With the current noise level that exists, the sensitivity advantage is of little use right now though.

Be careful as to who you let work on your radio. Most shops are major hacks. If they do good work, they will offer a GOOD warranty on it. Sean

i am also interested in any thoughts or comments on this radio.

725 wrote in message <9582-38380DEE-3@storefull-294.iap.bryant.webtv.net>...
Is this a decent radio for AM operation? I had owned a RG-99, but after talking on it for a while, it would heat up and start to squeal. Any

other suggestions for a good mobile radio..I use a Predator 10K antenna,
213 coax, and the mount is grounded to the truck frame..Thank you for
your advice.

I didn't see ANYTHING mentioned about race in that post. How did that get
brought up ?

As it is, what differentiates Foxie's latest boxes from the ones that she
used to build for Real Deal ? He was the one that used to call his boxes
"super's" when using the bigger transformers.   Sean

Depending on the size of the truck motor and the location of the unit, it can be very difficult and sometimes impossible to restart one of these in the dead of winter. I'm referring mainly to the large log haulers and construction or mining equipment that is larger than your average truck/dozer. These units have tires 10-20 feet tall.

In places like Alaska and the extreme northern latitudes, one of these large motors is never shut off in the winter. Once the motor cooled it would almost never turn over again until the spring thaw. You sometimes build fires under them to try and get the oil moving but this doesn't always work.

Your average tractor trailer motor will usually be left running unless city ordinances restrict this. There are many places in this country where the locals won't allow you to keep a tractor idling overnight in the winter or summer. I can assume it has to do with the pollution this causes moreso than the noise.

Most, if not all, rigs have a fuel return line from the motor. This returned fuel has been run through the warm fuel pump and is primarily responsible for keeping the fuel from gelling in the tanks. This is not what the return lines were primarily for but it's a good secondary benefit although not nearly successful enough. The fuel still manages to gel in the tanks sometimes.

I personally don't shut the truck off unless I'm only gonna be gone a couple hours or so. I have never had a tank gel on me but I have seen it happen to others and it's not a pretty sight to see a grown man or woman cry.

The hassle is being out in -20 to -30 degrees weather with a cold wind blowing trying to thaw the fuel lines and replacing the fuel filters. Worse yet is by the time you do get things thawed out enough to flow, your batteries are too cold to crank the motor long enough to pick up the fuel again. Now, you've spent the better part of two hours or more freezing your ass off just to have to find a phone to call a tow truck out. And this is a lucky scenario. Sometimes you have to wait in the frozen truck for help to stumble upon you. Many drivers, even wrapped in blankets, have gotten frostbite from being stuck in the middle of nowhere waiting for help.

So the short of it is, I'll gladly spend the money on fuel to keep my stuff warm and comfortable.

BobC

In the last few years, much attention has been given to the noise pollution created by Jake Brakes. Most truck makers have toned the exhaust noise down to a dull "put" "put" "put". There are of course those that must modify their rigs' exhaust system to make more horsepower but these are far and few between anymore due to noise laws around the country.
I confess that I am one of those guys that can still appreciate the great sound of a healthy motor and jake brake coming off a hill.

I'm having trouble envisioning this, but it sounds like a marine antenna. Basically the collective antenna, mount and coax are the antenna and provisions are made to match this to your radio's 50 Ohm antenna spigot. Normally this is accomplished by a tuning stub on the coax line at the PL259 connector. Yours sounds like a slightly different approach. I've used a marine whip only once. It worked okay, but the same whip mounted permanently worked better in every regard..

Foxie builds a good box if you know how to run it. They are maul boxes and require alot of drive to produce full output power.

just ,wondering what swing mod (if any) you guyes preffer for the 148GTL....Here are some examples:

1.cut or remove violet wire from TP 8, now solder this wire to the striped end of D44 . Now turn the radio over and locate VR10 {am power adj.} Once you find VR10 picture it in your mind and turn the radio back over to the solder trace side and solder a jumper from the left leg of this pot to ground (solderside up) . Now adjust vr 10 for a low dead key for high swing. NOTE THAT THE FRONT OF THE RADIO IS FACING YOU WHILE DOING THIS MOD. iF TP8 WILL NOT WORK TRY TP7 INSTEAD.....

2.connect the violet wire to 12 VDC at the on off switch instead of the diode. Also at VR 10,I cut the trace that supplies its voltage(the trace closer to the radio center--the only trace long enough to cut and bridge) then bridged the cut with a 10K resistor. Dead key is set at 3 watts swinging 26 watts (on my meter-my buddies Bird meter shows a swing of 38 Watts) AM & SSB

3.look in side your radio,there are to wires next to audio transformer,usualy purple and yellow,they are on tie point 7 and 8,take a 100uf 25 volt capacitor short it with a 82 ohm resistor,put this in line with the line that came off tp8put negative side to the board,then take the other wire and solder it to jp1.this is a super mod.it should drop dead key to about 2 watts and bring your swing to about 20 to 25 watts.this is exelent for driving a box.if it doesnt work well like i explained swap the wires.the super mod should be on the tp that goese to the driver.and Q is the scematic symbol for a transistor.

Yea Me to Quement was grand!
The son opened a cb and scanner only shop for about five years accross the street. He closed it down last year to concentrate on a web based shop.
He is at www.talkgear.com and he is the

most honest guy I know. He will beat prices and ship free over 100 purchase.

I got an email about the "old guy in San Leandro. I disagree with you on your
quoteing him the best. He is a nice guy and has recently closed shop. But his
prices were high and his tech work average. He made his buisiness on amp sales
and since the web has matured it has put him out to pasture. Like I said nice
guy but very few people have called him a
affordable guy.
Bills two way in Gilroy is web based and he to has great prices and is a good
guy
bills twoway.com

Thought I would give a shout out.

Have a great day...
Tod Kertz

This must be the CB Shop that I heard a truck driver last weekend speaking of.
I was going through West Memphis, Ark. fixing to cross the river into Memphis,
Tenn. Then I heard a driver telling another driver that he hooked his radio up
backwards.  He took it to the shop by the truck stop and the manb charged him
250.00 to replace a small part.  These are the shops that give the good shops
bad names.

I received quite a few emails on this, so i'll post the basic responses here and kill a bunch of "ducks" with one stone   :)

Yes, radios do suffer power starvation also. This can be verified by watching how badly your meter or display lights dim out when keying or modulating. Keep the factory power cord as short as possible. If you need a long run, cut the factory cord a few inches past the fuses (leaving them intact) and CAREFULLY splice in heavier wire. This is especially true for radios like 2960's, 2970's and 6900's. There are some aftermarket power cords that are WAY too thin. They should be AT LEAST 16 gauge or heavier for a standard CB type radio. Exports can make use of at least 14 gauge or so. The higher the carrier level and power output of the radio, the heavier the wire it needs.

It is not abnormal for the radio to still dim out slightly after doing the power cord upgrade. Many radios have insufficient size traces to carry the incoming voltage to the modulator / final section of the radio. While this too can be beefed up, be careful as to what you attempt. ANY mod should be done one step at a time while verifying proper operation along the way. If you goof up, you will know right away and be able to backtrack to where the mistake was done more easily.

If attempting any of this, ALWAYS make sure you pay attention to color coding and polarity. It would be a real bitch to get done with the mod and hook your radio up backwards. Believe me, it has happened more than once......

Take your time and triple check everything. No working on stuff when your tired either. Even if it was wrong, you might not be sharp enough to catch it. Sean

None of these are REAL safe. The purple wire trick will generaly gat you more output, But it is riskey. also the most wattage you will see out of that radio is about 7 on a bird 43 on am, you will almost double that number when you apply 12v to the purple wire, but don't say I did'nt warn ya.

My first suggestion would be to do a thorough study of the owner's manual. If nothing is there, get the tech manual.

Every pc that has a lock code that I have encountered has always had a way to clear it. It might be a hidden pushbutton or switch, a combination of switches that need to be pressed at power up, a place where a component or pin needs to be jumpered to ground momentarily etc.

Replace that cellular look-alike with a real antenna. You will be
surprised at the improvement. Even a mag mount antenna on top of the
cab will be far better.

> Ah, here we go again. What yard belongs to you, Jeff? Are you going
>to start the nonsense that ham operators, who also own a CB radio,
>cannot post to this newsgroup again?

to be specific, the cb ng as opposed to the ham ng's and i have NEVER said it was MY yard as to mean that i own it. if you and i were arguing this point, i would be refering to it as "your yard" and "my yard". most of the time, if i were talking to a specific group of people like the RF police for instance, i would refer to it as "our yard" and "your yard" in the collective context.

this was all in reference to the question about why is a certain segment of the ham community, (the disagreeable segment) on this ng instead of one of the other ham oriented ones? the particular segment refered to, it seemed, never had anything constructive to say. i would read through all of the posts and not one of this particular segment had anything but condemnations or insults to say and, coinsidently, they were always thrown at people who posted something in favor of or pertaining to illegal operations.

there have also been hams on there who have been helpfoll and answered questions from the legal cb community and had the sense to ignore the out-band, power meisters. go back 6 or 7 months through your archives and see if i have EVER attacked one of them. go back and also look to see if i've ever attacked a ham who came on in a neutral non-condemning manor and have debated the issue in a fair and even handed fashion.

go back and see if i've ever attacked ANY ham who EVER came in WITHOUT a smart-ass attitude and spoke about ANYTHING.

> And exactly who is the "WE" in your message? I have not seen a single
>CB operator in this newsgroup agree with your negative comments about
>ham radio operators. You are alone, Jeff. There is no "WE" when it
>comes to your opinions.

you haven't been reading ALL of the posts from others that don't share your views.

as a friendly suggestion, try reading ALL of the posted responses from ALL of the cb / out-banders who've been shot at by that particular segment of the ham community.

it may shock you to find out that i'm not as alone as you think.

>So, what you're trying to say is that that you're just an innocent
>victim that was minding your own business, innocently posting to this
>newsgroup, and all those ham operators that you talk about in your
>messages just decided to attack you out of the blue. All of those ham
>operators came at you in a threatening manner, so you had to attack them.

in essance yes but it hasn't been only me that has been attacked. it's everyone
else who doesn't cling to the opinions of that segment of the ham community.
you make it sound as though that segment was happily whistling dixie when, all
of a sudden, they were blind sided.
like i said, go back and read ALL of the posts and not a select few.
there have been some, yes. i have even gotten private, non-posted e-mails from
hams that i've never heard of on this ng. one had threatend to shut my F@#$^&
ASS down. i had never seen his ID'er here before. i let him have it by return
mail also but i havn't heard from him since. it's been several months.

> Nobody disputed any of the facts that Martin gave, mainly because none
>of the facts that he gave disagreed with anything that we said in this
>newsgroup.

not altogether true.
the RF police line has been that according to ITU treaties, the cb frequencies
were locked in at 4 watts and 40 channels and the out-bands were forbidden
lands. this was not what was in Martins tutorial that you've just agreed was
correct. as a matter of fact, the opposite is true for the eastern hemisphere.

>What we disagreed on was Martin's opinions of you. And I
>disagreed with your attempt to use him in an attempt to discredit the
>ham operators in this newsgroup (which you failed to do).

Martin's opinion of me is different from yours because i havn't treated him the
way that i've treated you.
WHY? you might ask?
it's because he hasn't treated me the way you and yours has.
i tend to treat people the way they treat me.
i wasn't using Martin to discredit the hams in this newsgroup. the hams in that
particular segment have done that very well all by themselves.
all i did was to provide the evidence of this.
how can you discredit anyone with facts. you can't. all you can do is show how
they have discerdited themselves or, at the least, have professed to have all
of the facts when, in reality, they had been wrong about frequency and power
assignments according to the ITU treaty.
their position had been that cb is locked in at 40 channels at 4 watts, case
closed. Martins references said otherwise.
did you happen to notice the tone of Martins letter? no where did i detect an
air of eliteism, snobbishness or condemning attitude. this is why, even though
he's a ham, i didn't blast him. i treated him with the same respect as he
afforded me.
the other segment gets the same respect from me as they afford me also albeit a
whole lot less. you get out of it what you put into it and they did get what
they gave.

>However, you said that he presented "facts that showed that, in some
>cases, they were wrong." Please show me where he presented any
>information that was in conflict with anything I said about the FCC and
>ITU in this newsgroup.

i have not seen ANYTHING in this ng from ANYONE except Martin that acknowledged
the fact that the ITU treatys allowed cb or higher power limits between 27.405

and 28.000, as a matter of fact, all have denied or ommited this information.

> Okay Jeff, show me one message where I have ranted about CB'ers. All
>of the messages that I've posted in the last ten years are still
>available at Daja.com (www.deja.com). I challenge you to find a single
>message where I have ranted about CB'ers. In fact, I challenge you to
>find a single message where I have ever said anything negative about
>CB'ers in general.
>

just for the sake of clarification, do you define cb'ers as, (ch 1--40 @ 4 watts max), or do you define cb'ers as, (26,000--27.995 @ 6+watts)?
there may be a misunderstanding between us as to the definition of the term "cb'er".
i will defer a response to your chalenge until i hear from you. please post AND e-mail me your definition. then i'll do my research as it would be useless if we have put 2 different meanings to this term.

>That is a lesson that you still need to learn.

believe me when i say that i HAVE learned that lesson well here.

> I don't go around making negative comments about groups of people,

regardless of your political affiliation, do you agree with the GROUPS of people of ALL political persuasions? is everyone right? have you NEVER disagreed with anyone? if you feel that you're right about something, and someone disagrees with you. in your view, they MUST be wrong which puts them in the negative end of the debate from your point of view. any agreement is positive just as any disagreement is negative. it's just a matter of ones point of view and what the facts may be. there is no front without a back, no positive terminal without a negative one and the whole world can't be in daylight at the same time. to beleive anything different is one dimentional thinking.

>Ah, here we go again. What yard belongs to you, Jeff?

one more thing on this subject.
if you re-read the post and all of the other posts where i refer to the word "yard", you'll find that i have never laid claim to the "yard" as my own in the literal sense. >the supporters of your position have brought the fight here to our <<<<<
>> yard
you are now discussing semantics. if i could actually lay claim to this ng as "my" yard, we wouldn't be having this conversation right now. this is not meant to be offensive to you personally but if this was "my" yard, i would be able to dictate that all who do not agree with me must leave. and as that hasn't happened yet, then i must obviously realize that this is not "my" yard. this was meant as a general illustration to distinguish between the cb and ham ng's.

>> i don't post inflamatory comments here, i just answer them.

let me clarify something on this.
what i say here may be and a lot of times is inflamatory. i don't pull the subject matter out of the air though. it is in response to inflamatory things that are written about others or myself concerning the 27.XXX mhz hobby in general.
what kind of response do you think i would receive if i were to go to rec.radio.amateur and start to condemn the hams there using eronious information, threats of FCC action that are so outlandish as to defy belief, attack people mothers and how they raised them, whether or not they were potty trained, their education, spelling, grammer,(dirty language not withstanding), questioning whether or not the were sexually abused by a male relative, comment on their maturity soley on the basis of the equipment they use, berate them for not having a higher class license, (anologous to not having any license at all), call them idiot, asshole or stupid for using the band of their choice what ever it may be, spam their questions or comments with condemnations and insults that have nothing what so ever to do with the subject at hand, tell them what they should and shouldn't do, try to intimidate them like the ham who said that he was going to submit to the FCC for further action, a list of all posts and e-mail addresses having subject matter pertaining to illegal ops, literally threaten people from around the world with the wrath of the FCC like the ham who threatend the guy that asked about a cb linear but didn't notice that his e-mail address ended in "U.K.", the last time i had checked, the FCC wasn't a division of interpol. and the list goes on and on. do you honestly think that the hams on that ng would welcome me with open arms and hand shakes? i seriously doubt it.
last night, i answered your post about my backing off from the ham community with my return fire to a lot of the napalm that has been comming our way.
you said that i could argue and fight with anyone that i pleased as long as i didn't lay insults on you, the ham hobby or community. i responded that the pace and direction would be set by the one that throws the first stone, to paraphrase myself. and, as long as you didn't get involved, it was fair to leave you out of it.
if a ham of the negative 27.415 + opinion were to come on and start to throw around insults as to our operating practices and start with the holier than thou attitude by virtue of his ticket, should my response be to him that his hair looks funny or his arms are too short? no, as it would be off from the subject at hand which would be radio and by who's authority did he come here and start ordering people around?
don't even try to say that, that didn't happen on this ng because it did all of the time up until several weeks ago.
i also told you that yes, for a while in the begining of the war, i had used the term "ham" generically until a ham came on and pointed out that not all hams agree with the position that the "RF police" hold on to.
to this, i responded by coining the phrase "RF police" to distinguish between the hams who do and don't agree with the "straight arrow rule book" opinion. (for the sake of peace, i did not use the terms used last night.)
as you have said your self, there are good and bad people. this can also be applied to people of differing opinions.in your opinion, i may be wrong for supporting the out-band position. in my opinion, i don't agree with your opinion. this doesn't mean that either one of us are bad, we just don't agree.
where i get VERY opinionated is when hams of a differing opinion from mine / ours get on and start in with the attacks mentioned above and below.

what kind of response do you think i would receive if i were to go to rec.radio.amateur and start to condemn the hams there using eronious information, threats of FCC action that are so outlandish as to defy belief, attack people mothers and how they raised them, potty training, their education, spelling, grammer,(dirty language not withstanding), questioning whether or not the were sexually abused by a male relative, comment on their maturity soley on the basis of the equipment they use, berate them for not having a higher class license, (anologous to not having any ticket at all), call them idiot, asshole or stupid for using the band of their choice what ever it may be, spam their questions with condemnations and insults that have nothing what so ever to do with the question at hand.
have a good night.

jeff

 I've tried that. Due to all the hills, trees and buildings,
 I can still only get 1 1/2 mile range with a 25ft tower.
 Even with a CB it takes 50 watts to get across town
 where I live. I'd like to at least get the elusive
 2 mile range that the manufacturer promises.

>

In a word yes. If the k40 is a mag mount set it in the middle of the stove or on the side of the fridge. My first base set up was a K4o mag mount stuck on the side of a Florescent light fixture with a 40 channel GE base and a JB 75 modulator. I talked all over the country on this rig. I also blanked TV's and kiied to Musac system in the DR's office below me. This is something you will need to think about
Good luck

>I agree that the majority of shops are VERY crooked. You would not believe
>how much work i get out of the shops in that area.

Lately I've seen alot of radios getting 12v jumps and the owners are charged $69- $109 for a "Super Mega Tune" for simply running a straight wire off the regulator to the final(s). If the final(s) aren't gone, already, they sound like crap and run hot as a firecracker. Sometimes they do even less output than the stock radio.
If you're in Va., stay away from the following CB shop exits: 89, 104, and 133 on I95, and Emporia. There is one decent shop at ex 98.

True. However I don't want to be accused of being an RF cop.
There are enough of them. While most folks know 28.000-29.700
is a ham band, I felt it necessary to remind the others. If
someone wants to get busted, ain't nothing I can do about it.

You Know You're In A Redneck Hospital When ...

The ambulance is a mule driven buckboard with a spinning lantern.

Anesthesiologist in bib overalls, feeds you a clear liquid out of a
mason jar.

Your proctologist, who watched Deliverance 200 times, asks you if can squeal
like a pig.

Surgical instruments include a stick of dynamite and a chain saw.

Immunizations are worn fanny-packs, full of lizard's feet, owl's beaks and
pig's ears.

Double by-pass surgery is only done when it's shown on The Learning Channel.

You have a choice of walkers, with or without a gun rack.

The bill is figured either in dollars or chickens.

Prompted by a phone call, I will post one time. We recommend specific coax lengths in mobile installations for a more constant field strength. The impedance of a mobile antenna system with insufficient ground plane will change with outside reactance. That is to say; while the vehicle is moving or it is moved close to large metal objects, the antenna impedance seen at the transmitter end of the coax changes. This is the reason for changes in watt readings when side by side shoot-outs occur. Certain lengths of coax will keep these changes to a minimum assuming that the antennas on the roof are 50 ohm.   I don't dispute any of the other posts. Happy Holidays from Fifty Five in Fla.

Nice,

Here's a mighty creative fallacy. Certain coax lengths can prevent "mutual impedance" variation caused by varying proximity metallic objects.

I am off to shoot myself, good bye world.

Bob.

Ps. Before I go, you should know the "correct" coax length can also:

Make you more attractive.
Lessen your chances of cancer.
Increase your salary.
Increase intelligence.
Increase sperm count.
Regrow hair / Remove hair
Cure headaches.
Help you lose weight.

Among hundreds of other things.

network55@webtv.net wrote:

> Prompted by a phone call, I will post one time. We recommend specific coax lengths in mobile installations for a more constant field strength. The impedance of a mobile antenna system with insufficient ground plane will change with outside reactance. That is to say; while the vehicle is moving or it is moved close to large metal objects, the antenna impedance seen at the transmitter end of the coax changes. This is the reason for changes in watt readings when side by side shoot-outs occur. Certain lengths of coax will keep these changes to a minimum assuming that the antennas on the roof are 50 ohm.   I don't dispute any of the other posts. Happy Holidays from Fifty Five in Fla.

Now you're talking though you'll have more hurdles to overcome.

Do a search on: tennamatic

and see if you come up with anything.

Not sure this would be of much interest on this ng as it's maybe really
only suited to multi-band antenna's.

Are you considering the phase detector route?

Happy to discuss this further here or via e-mail.

Phil / UK

If you haven't shot yourself yet......

You will..........

You forgot this one................

A repost from the past:

****

After much discussion on what coax length is proper to use on a mobile installation, i decided to sum up my thoughts on this subject. Before i start, i have to say that there is no such "proper" way that will suit all installations. Each method has its own advantages, and disadvantages. Each method is neither right or wrong.

These are the three methods discussed here.

1. Using the shortest length possible
2. Using an electrical half (or even) wavelength piece of coax
3. Using an electrical three quarter (or odd) length piece of coax

that is 18 feet long

Each installation of an antenna may, or may not, take advantage of all of the individual properties of these coax lengths. It is up to the operator to determine what best suits him.

....

Method ones advantages:
1. The lowest loss of all methods. *There is hardly any loss in any

method to begin with

Method one disadvantages:
1. If the shortest length falls around the nine foot area, and if this piece of coax becomes an acceptable counterpoise to the antenna,

then a voltage maximum will occur at the radio. This will cause a high SWR reading at that point.

....

Method two advantages:

1. The load is mirrored at the radios end. This gives the most accurate SWR reading at the radio.

Method two disadvantages:

1. Because the load is mirrored at the radio end, a direct short or open at the antenna will result in an infinite SWR at the radio. Whereas any other length other than this length will show a less than infinite SWR.

....

Method three advantages:

1. Load variations at the radios end are spread out. This increases the SWR bandwidth at the radios end. *this does not change the actual SWR
2. This length, if it becomes an acceptable path for a counterpoise, will present a voltage minimum at the radio. This will have negligible effect on the SWR at the radio.

Method three disadvantages: none

....

It should be pointed out that the first thing you should do is resonate the antenna at the desired frequency, no matter what method you choose.

It should also be pointed out that any length of coax can be used. Its advantages are: The most convenient of them all.

....

Here is the relationship of the impedance shown at the radios end of the coax, when using a 1/4, 3/4 or 1-1/4 ect. feed line.

Zms = impedance of matching section, or coax Z
Za = antenna resistance
Zl = line impedance, or what the radio sees

```
              -------------------
Zms = \/    Za     Zl
```

Or the square root of (Za times Zl) equals Zms

So for example Za = 25 ohms, Zms = 50 ohms, then Zl= 100 ohms or an inverted but identical match

....

I have not found a way to express the broadening of the SWR at the radio with a quarter wave transformer mathematically, but i have found the reason.

When the antennas resistance at resonance is less than the characteristic impedance of the coax, this being the normal case, and if we move off the resonant frequency we find this.

Because of the inverting action of a quarter wave matching section, the added inductive reactance at the antenna, when you go higher in frequency, is partially canceled by the added capacitive reactance, that comes from the former quarter wave section, that is now more than a quarter wave matching section.

The same inverting action takes place if you go lower in frequency. In this case the added capacitive reactance at the antenna, is partially canceled by the added inductive reactance of the now less than quarter wave matching section.

One thing should be noted. This inverting action that takes place (adding Xl with < Fr),(adding Xc with >Fr) with a quarter wave matching section inverts itself when the impedance of the antenna is greater than the characteristic impedance of the coax. In this case just the opposite action takes place. In other words.

When the impedance of the antenna is lower than 50 ohms, the inverting action works to increase the bandwidth at the radios end. When the impedance at the antenna is greater than 50 ohms, the inversion that takes place works to decrease the bandwidth at the radio. Once again, normal resonated antennas on mobiles are somewhat lower than 50 ohms.

I gotta get my two cents in here. And I hope it's worth at least that
much!

First off, coax length will not affect anything, if everything is
perfectly
matched, the moon is in phase, and your cat didn't didn't leave any
juicy tidbits for the dog in the litter box. Well, OK, it's not
lossless,
right? So anything flying up and down the cable does lose just a bit.

But what people always seem to forget is perfect systems aren't
the norm. For example, cut (1/4 wavelength) pieces of 75 ohm cable
are used to make a harness for dual antennas. Why 1/4 wavelength?
Well, length DOES matter. Without going into the match involved, I
think
it works out that a 1/4 wavelength inverts the 'apparant' impedance
of a mismatched point around the impedance of the cable. So, try to
just tie two 50 ohm resistors in parallel, what do you get? 25 ohms.
So
why does 2 antennas work? Well, the 50ohm antennea is fed by a 70

or so ohm cable of 1/4 wavelength. So it is seen as over 90 ohms at the other end of the coax, but there are two coax pieces tied together so it's like two resistors in parallel or close to 50 ohms.

Now another point to all this, is that the 'meters' that everyone seems to be using to do this comparison are NOT power meters, regardless of what the guy at Radio Shack or HRO or wherever told you. (Well, ok, some may be, but if you paid anything reasonable for your meter, forget it!) They are VOLTMETERS! They are only accurate, or as accurate as they will ever get, when they are plugging into a perfectly matched system and the load is purely resistive. But they do fine for most work.

HOWEVER, when you get a 1.2:1 SWR, that's not only an indication of reflected power, but if you were to be able to see down the cable with an accurate voltmeter, you would find that the voltage varries up and down by a ratio of 1.2:1 as well. And so would the current (but current peaks would be at voltage mins, and vice versa). If you had 2:1 SWR, you would be able to read voltages that are TWICE what they are at other locations.

Don't believe it? Take say 5 short pieces of cable and barrel connectors, and set up a small rig to two dummy loads on a "T" connector. That will give you at LEAST a 2:1 SWR. Now put your meter in the line and do quick test for power at each of the barrel connectors. (Please keep in mind that your barrel connector/cable assembly is going to be crap for impedance even under the best of conditions, but this should get the point across. And no, I haven't done it, but it SHOULD work!)

Remember, all the meters for power in the rig are just voltmeters, not real power meters. And antennas and cables are not perfect.

The bottom line is the length of the cable doesn't matter, if everything else is ok. But it CAN hide things when things are not.

Mike

In addition:

Take these typical voltage variations that you speak of. Couple them
to a typical SWR meter and you will see different readings. Why? Most
all SWR meters are less sensitive as the voltage gets lower.

Many people know that. It just means that the input is not properly tuned
and the amp isn't very efficient. Sean

I believe it was a suggestion, perhaps a good one at that.  Whats the point
of having a good signal if your audio is shit.  Use your brain and not your
dick, and stop being cocky!  Then you will have answered it for yourself.

Just a suggestion of course.

And what would make the 2879's Foxie uses need more drive to perform

properly? To me when the amp gives me good output with the least amount of
drive it then is right, until I would keep working.
Just my .2 $

I have a lafayette 2400FM with a resistor (R47) burnt.

The radio seems to be working ok but has low output on SSB.

Does anyone have info on this radio. I need the value of the resistor (R47)
and what part of the circuit it is in.

Thanks
Richard

On my '91 Exploder, just forward of the luggage rack, there is a plastic
plug cap.  I pulled the plug and installed an egg-type antenna mount.  Later
I put a Tullos Ball mount there for better watt handling and sturdiness.
See if you have one on yours.  You won't need to drill because the hole is
already there.  Have fun...

You run this risk with what ever kind of equipment you install in anything.
So, the answer here folks is, buy insurance. That is why you need to pay out
some of those hard earned bucks to keep yourself and shop covered in case
something like this happens.

CB Radio repair is not really a hobby anymore. Just like car stereo systems
aren't. So when we all read the post about wanting something for nothing and a
shop pipes up with a comment like, this is how we make our living, think about
all the expenses a legitamate CB Shop must incur to keep you communicating.

Anything installed in a vehicle can cause problems if not carefully and thoughtfully installed. I am not sure its the shops that cause the problems here. I am not taking up for any of us. But I can say I have stepped into a few vehicles, trucks, pickups and cars and seen some real iffy installations. It wasn't done by a shop. It was self inflicted.

I show them the pitfalls and then let them decide whether or not they are going to improve the operations. Lets just pop out the real issue. Some people will not pay someone to proffessionally install equipment. Afterall, twisting two wires together shouldn't be all that hard? Yeah that wire not being used on the lamp should be good enough :)

PS. We are one of those shops that pay out lotsa bucks every year to protect us against anything that might happen. God forbid

God Bless and happy holidays.

They only have a part of the button push combinations, which don't work on this radio. I have since found that to get it working on all frequencies and modes, a resistor has to be added across the CPU. It now covers 26.065 - 28.315 and 40 ch UK FM. If anyone needs the mod let me know.
Chris

I would be pleased if I never heard any more skip on the radio. I hate
it. It serves no purpose, it proves nothing. I much prefer to talk
local, say within a 50 mile radius. All the skip we hear in my area is
foreign language and just messes up everything as far as local talk
goes.I have been hearing skip for 39 years on my CB radios and have
never gotten use to it. I guess it will never end. Bah humbug.

Hi,
I may try the wire reflector.I wanted to use a horizontal reflector to reduce wind load and make the beam a little easier to get up.I am planning to move this summer so I didn't want to put up a tower now,but wanted to play with the beam.Iheard a dx station on a moonraker built this way after I started my project,but didn't get any particulars on it.Also could not make contact with him.He had a good signal from the west coast to my east coast location so Ithink it worked well.Any way thanks for your input.

It should cover a hell of a lot more than that.

You have put it in UK mode.

Now put it in International Mode, and you will be happy!

Here's yet another question. What is a good am HF transceiver made by the Military that has 1-30mhz coverage, and is fairly easily modifiable by a tech, that can be found on the used military surplus market? A radio that can stand up to the best of them?

You will get no range with the built in antenna. Get an external
antenna.

Julian,

No licensed required in the USA. Channel 19 is used by truckers and travellers, channel 9 is used for emergencies. I wouldn't rely on the unit for emergency assistance but it could make a good travel partner. Just be careful you might get bitten by the CB bug! :->

MC

Is this a plate modulated affair? Let me know, I may be able to help.

Hell, you can talk from Baltimore to California with that same setup!

The real fun starts here after 8PM, when the noise level drops.

Hi folks:

I need a rubber duck antenna for a handheld cb, the type that had a bnc connector to attach to the cb. Anybody have one to spare?

This would be for a Cobra HH34, although I doubt that the actual radio model number makes much difference. If you know better, let me know that, too.

Thanks...

- Dave

It is a really great radio. The problem is, people seem to be hell-bent on making them into shitty radios with these rather dubious "swing" mods.

I'm waiting to see some proof that "swing" mods increase range. I know they don't because I've done experiments with and without. A 100% modulated carrier "carries" the farthest. Some people can't grasp the reality the the carrier serves to demodulate the sidebands at the receiving end. Turn down the carrier (regardless of how badly you are overmodulating) and you've decreased your range. Period!

MC just got on down!

Hi Stephen,

Now is not necessarily the best time to get into CB with a handheld. The sun spot activity is very high right now and you are going to be hearing a lot of skip. Trying to work skip with a squawkietawkie is a bit like trying to shoot an elephant with a slingshot. Sad really, because 22 years ago you could shoot skip with a 100mW walkie. Now there are so many high-powered stations on the band that the noise floor even on a clear channel is so high that you can't hear anything. Your best bet is to try it at night when the activity dies down and you should be able to raise some locals.

MC

Hello Richard: The greatest CB Beam Antenna web site is the MaCo site on there beam antennas, this is a real treasure on CB Beam Antennas. Its at:
http://www.majestic-comm.com/maco/support/index.htm

A good book is "The Truth About CB Antennas" available at Radio Amateur Call book, at phone number 1-800-278-8477

The ARRL has a antenna book, that is also well worth the price of admission, its called the "The ARRL Antenna Book" and its available at:
http://www.arrl.org/catalog/

Here's some free advise: If you are thinking that making your own beam antenna to save money, and your a first time builder .... I stonily suggest buying a manufactured CB Beam Antenna first! The aluminum tubing, home-brew engineering, running around for parts and pieces, and testing for a first time around the horn CB Beam Antenna builder, is a lot more that meets the eye. Its like a Ice Burg, all the important and dangours stuff is hidden!

A Home Brew CB Beam Antenna can be made and will work well, and your changes for success are significantly increased if you do your home work and figure out what you want, and sample the waters. You need to read the suggested books I have mentioned, and look around at the guys who have a CB Beam Antenna up and running. I suggest just walking up to the guys door and ask him for all the poop! I've stopped by Ham Radio guys and asked them for their inputs, and most of it was worth its weight in Gold.

You will need a good antenna analyzer, MFJ, and AEA make good ones, I have both. These antenna analyzers will tell you the SWR and antenna resistance's, and reactance's.

Matching the impedance of the transmission line (The coax) to the antenna will prove to be another hurtle. The books will show this for you. Call the guys up at MaCo, they well probably sell you some of the parts and pieces.

Another good tool for beam antennas, is a antenna software program, that will show where the antennas energy pattern looks like. I use Eznec.

Let me know how you make out there, or if ya need more help.

Jay in the Mojave .... Living out here in the Great Mojave Desert, the skip comes all the way in from Texas, and it ain't so hot no more, Ten-4.

Thanks for the info MC 10kW Jesus. You are right about that skip that is for
sure. But I dont mind it, would be nice to talk back however. So far just
messing around on it just a little I have talked to someone five miles away.
The four foot antenna helps but I am going to get an external.

Hello All: Hoody do, from the Great Mojave Desert.

I am looking for a old, 1961 to 1964 or there abouts, Hy-Gain 5/8 CB Base Antenna.
I need the type that has a bell looking base insulator, and the 3 to 4 feet long tuning wire that travels up and down the main vertical element of the antenna, that has 3 plastic supports.

The popular Hy-Gain Penetrator 500 evolved from this antenna I am looking for. The later more popular Hy-Gain Penetrator 500, that I am not looking for can be seen at Woody World CB Gazette, click on the "Reader Mail" on the left hand side, its at:
http://www.cbgazette.com/gaz2.html

I can sent you a .jpg picture of it. I would like buy this antenna or at least have a copy of the Hy-Gain assembly instructions for this type of antenna.

Thank you, a hole bunch.

Jay in the Mojave

as a new cb user inheriting a friends old cb radio, i find myself perplexed by two particular switches on the front...

the first can be set to either HI, or LO, and I have an inkling that this is the transmission power, however, the next one has me stumped, it can be set to either DX or LOC, I have no idea what this does, and would really be grateful if anyone would spend a minute to enlighten me.

Thanks

Peter

One thing thats great about CB is that you never know what your gonna hear or what the conditions might bring in. Always something new to surprise you. Even when the band goes suddenly dead quiet, thats a nifty surprise!

Greetings!

The C190 mod is for less RFI. [below]

The R124 R126 combos change the tone to a higher fidelity.

The C102 has very little effect on impedance to the next stage, it's more like a tonal filter. I know we can split hairs on this, but when running a stock mike, the fidelity improves by removing this cap.

IMHO - Tone is a concern when mobile, too flat or monotone-ish, the radio never really provides to my desire to sound more like some of the other AM-only radios that have much more natural sounds to them.

Of course you can't get all that fidelity in an SSB radio, but a lot of the fidleity needed for inflections is passed thru with flying colors. It helps with the "punch" needed to get thru a pile-up.

C102 and the R124/R126 combo changes the results.

The C190 mod, affects output tank, brings in the carrier to audio - lessening the effects of audio based modulation interference.

If you re-evaluate the changes, the tone is increased to help the stock mike provide the punch needed. The C190 change lessens the effects of those changes for RFI/TVI problems that will arise if the radio is run wide open on/as a, Base.

About C190-
It was something I found out when I do repairs. People kept on tuning for carrier, but not audio. Changing this cap and the tank coil retuned, brought a lot, and I mean a *LOT* less RFI even though it's a performance hit. Audio follows carrier envelope. A lot better at the audio end and less TVI.

The Cap change isn't needed if you don't do the purple to RF choke, but there is a change thats needed if you decide to do so, and thats where C190 comes into play.

Carrier power is in the same spot on the tank coil tune, but changing the cap allows you to tune the audio and carrier together. Just try it sometime when you have a few minutes.

Acts more like the "Swing" that really should occur. Ahemn...;-)

But the main idea was to take the power off the AM regulator to increase the carrier power by the purple wire to RF choke mod. This also improves the modulation - but you still will have some "artifacts" in the power change, promoting more TVI. The cap change, with the power conversion from AM regulator to RF choke - you arrive to a new value thats necessary for that cap substitution.

Just check it out and see what I'm talking about.

While Dancing with the Mouse on Sun, 05 Dec 1999 02:12:32 GMT, the Modem interrupted with an MNI from "MC 10kW Jesus <qsl27@hotmail.com>", and the MotherBoard buffered this to Video RAM:

:+> Andy, you know, I normally don't take exception to what you write but
:+> this is one exception! When I see the term "swing mod'" used, I
:+> immediately feel my gotchies tighten. :->

Thanks for letting me know it wasn't cooties!

Regards!

ah-yes....super mods.

They are helpful under certain situations if they work correctly. if a "mod kit" will allow the radio to dead key two watts or so, and swing maximum power, it's working correctly.Many are pure sham.

lets look at why they work at all.

AM radios that drive a transistor amps, sound cleaner, and run cooler when driven in this manner., You can merely turn down the radio, but loose allot of swing that should be available to drive the amp.

Super Mod's DO NOT give you "super mega power" not extra wattage that I am aware of. Tricking out the regulator circuit on exports usually reduces modulation even though you do see "extra peak wattage" on your wattmeter,

The reason that "mods" seem to work at all is simple, the audio modulation circuit only puts out a limited amount of milliwatts to the transmit stage. That is why in any radio, the less it dead keys, the louder the audio will be.

when you ask for more wattage from a radio, more AUDIO output is required to drive the transmitter at the same level. I'm not talking about power mics, I am talking about the audio output stage that injects the audio into the RF transmit (driver) stage, It's easy to get more RF power from a radio than the modulation circuit can handle. Tricking out the regulator in exports will easily surpass the drive requirements of the audio circuit. It "looks good" but is actually not as loud.

So, if the peak power is increased, the audio output circuit should be increased as well, and this is not easy. I have experimented with a export radio, with the audio circuit disabled, using a 5 watt equalizer to drive the transmitter. this worked very well, but is not very practical.

It's the balance of audio input and the amount of RF power that determines modulation. Both must be within balance.

my 2 cents.

Greetings!

Hi/Low may mean power, or Tonal quality from the speaker.

If you key up the radio and notice the RF meter reading, then switch this control to the other position while still transmitting, note the reading again.

If it changes, then it's the RF power switch.

LOC/DX [Local - Distance] switch is a crude, read: rough, means to act like the variable RF gain control in more modern CB's. Controls sensitivity of the receiver side of the radio, helps when you are too close to another CB'er and your radio can't desensitize itself enough to hear the other person clearly - more like they sound "pinched up" or no audio at all just a nice quiet carrier signal. This control takes care of that to a point - its' not fool-proof but does the job.

While Dancing with the Mouse on Sun, 5 Dec 1999 18:28:32 -0000, the Modem interrupted with an MNI from ""Peter Laurens" <peterlaurens@hotmail.com>", and the MotherBoard buffered this to Video RAM:

Thats the plan. I wanted to keep it in the 5 watt range. Bad thing about it I was cleaning out the garage a couple of months ago and threw out a junker that had one in it.

Greetings!

Jumper final to constant DC. 13.8V -I use output side of RF choke T1 - voltage drop across it doesn't affect performance and provides some filtering of RF leakage from getting back to parts of the radio that are more sensitive to RF. T1 output side goes to branch trace to pin 1 of IC6-TDA7222p and R193.

Change resistors R124/R126 and adjust recovery time of ALC/AMC by changing R127 to 3.3K.

Change tonal response by removing C102.

All of the above can be done without having to clip the limiter and works well with the stock mike.

The last one, and I'll have to wait until more people try this, is to change C190 to another larger value [between 470pF to 560pF] and some people are questioning that one so it'll have to wait.

I like the results I get...but then I'm not everybody...

Greetings!

Good points...

Since it's been mentioned, I'll add my two cents...

With audio drive from the Driver/Final pair now just down to the Driver, you may want to mess around with the Driver section to improve it's performance when it's the only section being driven by audio.

Some Uniden radios - have no capacitance or use a 100pF on the 2166 Driver base/emitter-ground to dampen 2-nd harmonics produced. Lowering the value to a 47pF or 33pF affects output and increases drive. Also increases TVI - thats why it's so heavily damped to lessen drive from that stage.

The Final, either a 1969 or a 2312, uses an L/C in series with each other, along with heavy capacitance, to 390pF as it's sourced to ground for impedance purposes. Adding another cap, of 33pF of 47pF variety, or changing the source ground reference cap of 390, to a 420pF, takes into consideration the change in output impedance the Final now works under.

When you change the Final voltage to steady state DC, this stage can be tweaked to act like a Modulator as you'd find in a low-drive single stage linear amp - without having to suffer the problems from using such current munchers. Audio is also improved to a point but artifacts, or RFI problems - need to be filtered out so a change is needed in *both* stages.

While Dancing with the Mouse on Sun, 5 Dec 1999 15:04:41 -0600, the Modem interrupted with an MNI from ""Tempola Music Rolls" <tempola@i1.net>", and the MotherBoard buffered this to Video RAM:

:+> ah-yes....super mods.
:+>

```
:+> They are helpful under certain situations if they work correctly. if a "mod
:+> kit" will allow the radio to dead key two watts or so, and swing maximum
:+> power, it's working correctly.Many are pure sham.
:+>
:+> lets look at why they work at all.
:+>
:+> AM radios that drive a transistor amps, sound cleaner, and run cooler when
:+> driven in this manner., You can merely turn down the radio, but loose allot
:+> of swing that should be available to drive the amp.
:+>
:+> Super Mod's DO NOT give you "super mega power" not extra wattage that I am
:+> aware of. Tricking out the regulator circuit on exports usually reduces
:+> modulation even though you do see "extra peak wattage" on your wattmeter,
:+>
:+> The reason that "mods" seem to work at all is simple, the audio modulation
:+> circuit only puts out a limited amount of milliwatts to the transmit stage.
:+> That is why in any radio, the less it dead keys, the louder the audio will
:+> be.
:+>
:+> when you ask for more wattage from a radio,  more AUDIO output is required
:+> to drive the transmitter at the same level. I'm not talking about power
:+> mics, I am talking about the audio output stage that injects the audio into
:+> the RF transmit (driver) stage, It's easy to get more RF power from a radio
:+> than the modulation circuit can handle. Tricking out the regulator in
:+> exports will easily surpass the drive requirements of the audio circuit. It
:+> "looks good" but is actually not as loud.
:+>
:+> So, if the peak power is increased, the audio output circuit should be
:+> increased as well, and this is not easy. I have experimented with a export
:+> radio, with the audio circuit disabled, using a 5 watt equalizer to drive
:+> the transmitter. this worked very well, but is  not very practical.
:+>
:+> It's the balance of audio input and the amount of RF power that determines
:+> modulation.  Both must be within balance.
:+>
:+> my 2 cents.
:+> Hillbilly
:+> Missouri

What is it? What is it for ? Why does the FCC see fit to waste so much money trying to prevent people from using them?What do they hurt? Why

```
does the fcc make such a big thing about them. What is wrong with a
grown man using something to increase his radio range a bit? Who , when,
where. why ? BAH HUMBUG, Maybe I will get to see one someday. The only
reason it is illegal is because the FCC says so and it gives them
something to waste tax dollars on.

Handhelds at CB freqs just won't do much.I run a rural mailroute in MT and I'm always out of the cellular area.CB worked OK for a few years but I was running illegal power and freqs and got caught by the FCC.Legal CB was OK until the skip came in,then it was easy to talk to Japan but impossible to get a few miles away.

Finally I got my amateur license and even in MT its hard to get away from the linked repeater systems on 2 meters,some have autopatch(telephone)capability and the calls are FREE!Handhelds work pretty good for this.

I also like radio as a hobby so I put a 10,12,15,17,20,30,40,80,160(also will do CB in an emergency)meter HF rig in the vehicle I drive on the route.I've worked over a hondred countries while delivering the mail.

For emergency use you can't beat ham.

It doesn't make much of a difference or non at all,depending on why your worried about it and what you are trying to do???

VF does vary by manufacturer and some make several models of RG58 etc.Call or e=mail the manufacturer if this is really important(phasing harness).

>something to waste tax dollars on.

It's a RF amp? They want the HAMS to
maintain their elite status.

Truckers started using altered ham
linear to boost their rf output
over the interference and static
of the cb band. 4 watts gets
swallowed at a pretty short
range.

The FCC can fine you for using low-wattage
too if you happen to accidently skip your
signal too far. They can prolly fine you
for causing radio interference with a
blender if they wanted to. They mostly
just follow up on complaints from neighbors
when they hear you thru their tv speaker.
I wouldn't use one on a base station unless
you live out in the boonies.

The receive amp brings in EVERYTHING stronger. The level it brings
the signal to can be enough to overload the front end circuits of
your receiver. When this happens, AM stations can bleed on your
CB. You can also hear images of stuff above and below the CB band.

Greetings
Has anybody yet found how to modify
the colector voltage on tr-51, so as to
increase the supply voltage to the driver
circuit? I not sure about this but does
tr-49 have anything to do with this increase or
decrease of the output of tr-51.and it's colector
voltage output.?
Regards.

This 40 channel Midland CB is Brand New and has never been taken out of the box, the reason I`m selling it is because I bought it for a family member for Christmas and I found out later that someone else also bought him a CB radio.

This is a real nice 40 channel AM (not ssb) CB mobile radio with weather stations.
FREE SHIPPING to any where in the U.S.A. only.
The price is $90.00

CB is 11 meters.

You might be thinking of 10 meter amateur radio transceiver mods.

Well first day using it and im hooked. During the day couldnt get much range
out of it. Could pick up allot of skip but only could talk maybe three four
miles from inside my house. I found a local that I might buy a Washington
from. Not sure on the model but he was using it and man he just about blew
my speakers lol. $125 is what he wants for it. Cant get the Emporer its
allready sold.

I don't think the FCC has spent any money looking for people with illegal amps,linear or not.All bands have power level limits for a number of reasons.If a few people use many times more than the others on a band then it makes the band useless for the people operating legally,although you probably don't care.

Since CB amps aren't regulated many are very "dirty".

  Your not making sense,CB and 11 meters are the same thing,no mods
required.The other portions of 11 are allocated to other services.

What should it cover in International mode? Is the list of modes on the following page complete?
http://members.tripod.com/~Malzev/cb-radio/george_.htm
The most George will cover is 240ch (I assume this is the International mode) according to this page, but it doesn't say what the frequency ranges are.

Thanks.

Here is some REAL CB news. Antenna Specialists, formerly of Cleveland, Ohio and more recently in Solon, Ohio has moved. NE Ohio use to be the antenna capital of the world. But in a Deut. 28 land, they moved to Texas and/or Mexico, and like Hustler and all other companies, WHEN they move, the quality goes DOWN. Every time a company (factory) moves, the quality goes down. That includes companies that move from country to country. The quality goes worse & worse. That's WHY you shouldn't buy Cobra CB's or anything made in CHINA.

This AS news may be a few months or more old, but it is a real shame. I worked there in '77 for a while.   Dave

Greetings folks..

Llyod, you forgot to show us a picture of your truck with 57 antennas sticking out of it. It's amazing that you still have enough room for rotating beacons on the roof and a magnetic BARF sign for the door. I suppose you've got a uniform too? LOL ! I'm sorry.. folks this is just amazing what's happening to our society these days..

It *does* make me wonder what he's going to do after January 1st with this Web site. If there was *ever* a piece of code that I hoped wasn't Y2K compliant - this now takes the cake.

Cheers,
Gary

The mere fact that he's mentioning the word "Nazi" on "his" Web page:

"For the record, I am not a Nazi, a neo-Nazi, a racist or an anti-Semite..."

shows there was some concern at one time if not now - at least in his mind.

  HAMS have too many rules to abide by. It would
  get pretty boring without all the speed-jive and coon-asses
  you get on CB. No speed-trap alerts on the HAM freqs either.
  Bucking the FCC and getting away with it gives you a feeling
  that you've done something meaningful. Do you realize how
  many commerical truckers operate hi-power radios? There is
  no way that the FCC can regain control of CB. They should
  cap the wattage at a more reasonable limit or just deregulate
  it completely. Tell me how a shortwave tranciever is
  practical when it's operated at a puny 4 watts? Ad a measily
  50 watts and you have a radio that you can actually communicate
  with. Ad the fact that the band sits in a DX window and
  there you go. It makes the FCC look as tho they can't
  do their jobs tho doesn't it? They're just a licensing agency. No
  license is required for CB.  End of story. Deregulate.

Hey, low-power does work in ham radio.

I need a tiny radio with lower frequencies. I've been looking at the Deer Slayer 240 and the Eagle Apache 240. Which is the better all around radio? All comments would be very much appreciated. Thanks.

Please read all of this post.

1. I have a WORKING Realistic TRC-458 which is a 40 channel CB base
AM/SSB radio that I am selling for a freind. The radio is some
scratches and a bit dirty, (belonged to a smoker). Has NEVER had any
extra channels put in it.
Great radio, as it can do over 200 channels. Info on the net. It has
the 858 chip.
Full service manual included (a $ 25.00 value) and a new separate 858
chip.
Sell 1 and 2 for $ 75.00 plus shipping.

Picture avaliable for the TRC-458 ! ! !

2. A TRC-449 mobile CB radio (same board as the TRC-458) for parts.

no mics

Please reply to email as I do not often get to this newsgroup. He
wants to get this stuff sold ASAP, so please reply ASAP. I will reply
to you Monday to Friday only.

Thank-you,
Greg

I wouldn't go with either, they don't seem to be too well made.
Personally I own a Cherokee CM-10 (about US$80 from Bill's 2 Way)
with expanded frequencies and love it. It is very small and does
the job right. But be aware that if you intend to transmit over
a wide range of freqs and bands you must tune your antenna for
proper SWR. I have never really TX'd from my Cherokee outside of
the CB band.

thats one mans opinion and i respect it but its not the only way of seeing things. i look at the dx as fun and exciting. never know where youll be able to talk to or hear next. why not try for your dxcc or iotas on 11meters? it has been done many many times and will continue. for the guys that dont like dx 2 meters is a perfect place to be.

Good luck and best regards from Tim 082.

But what a difference a few KHz makes.

The 10 meter ham band is not a competition between stations trying to step on each other. For local work, there's no need to be louder than the next guy. (Heck, you're grateful to just hook up with the next guy)

When the band is open, rip-roaring DX is typically accomplished with average barefoot transceiver power, or much less. The reason is that most hams have tried this experiment: during QSO with DX station, both drop power to a few watts. They find very little difference in signal strength as a result.

Most hams don't see the need for or want the expense, extra hassle, TVI issues, and higher electric bills that a linear amp brings.

Granted, these fact pertain to the majority of the ham population who are not contesters (a few weekends a year) or dedicated outlaw CBers (who happen to hold a ham license).

Also, requiring one to identify themselves to the federal government and pass a basic qualifying exam in exchange for amateur radio privileges is not "elitist". Last time I checked, the amateur license was open to all, regardless of ethnic background, political and religious view, age, sex, or economic status.

I've got a cd antenna mounting question for you all. I'm currently debating between two possible cb antenna mounting positions, and I just need some help deciding between the two. I've got a 48" fiberglass antenna. (Wilson 1000) I'm a newbie to the cb/radio world, so I apologize in advance for my ignorance on the subject.

I don't want to drill any holes in my pickup (Toyota Tacoma), so that limits my mounting position choices. There are two possibilities that I can think of for my truck that would seem to be good. Could anyone tell me the pro's and con's of the two mounting positions listed below?

1) Magnet mount on top of the cab. I guess a benefit here would be the flat ground plane, correct? Radio Shack has a big magnet mount kit that accepts standard antenna screw thread, and advertises that it will hold up to a 48" fiberglass whip. I'd just have to remember to remove the thing when I park in the city.

2) I've figured out a way to mount the antenna to a corner of the truck bed. Toyota Tacomas have small, metal tie-down brackets screwed into each corner of the bed. I can make a custom metal bracket which would bolt in place of one of those brackets, which would more permanently hold the antenna right there in the corner. I figure a rear corner would be best. (Away from the cab.) This has the benefit of providing a good ground to the pickup. (Is that important? Seems like a magnet mount would not have that ground, since there's a big magnet and a bunch of paint between the antenna and the truck body..) The only problems are that it's about 2 feet lower than where the magnet mount would be, and it doesn't have the ground plane.

Any ideas? (Please email if you can.)
Thanks!

I was trying to keep it at a more simple level, but:

C= Capacitance in farads
L= Inductance in henrys
Q= Charge in coulombs
V= Potential in volts
R= Resistance in ohms
E = EMF (Electro Motive Force) in (V)olts
P = Power in watts
I = Current in amperes
X= reactance in ohms
pi= 3.1415~

Now for simple formula's (theorems/laws):

I = E / R
E= I*R
R=E / I

For two resistors/capacitors (replace R with C) in Parallel:

Rt = (R1 * R2) / (R1 + R2)

Resistors/Capacitors (replace R with C) in series:

Rt = R1 + R2 + R3 +....

Q=C*V

W= ((V^2)*C) / 2

I = E / X, E = I*X, X=E / I

Then from there you get a little more advanced. I would suggest a good book on Electronics, RF Circuits, and Propagation. Then you'll get to go on to read about Chebyshev High/Low Pass Filters, Nonlinear and active networks, PLL's, VCO's,Colpitts Oscillators, DDS, Chokes, NPN, PNP, Bi-Polar transistors, etc, etc, etc, etc.....

My friend just leased a pickup with the "no holes" clause. He mounted a pipe flange to the frame, installed an elbow and came up even with the top of the cab between the bed and cab. He screwed on another flange and mounted his antenna there. He loves it.

Part of the problem in my area is that although the State Patrol has an
excellent base station it is manned, er, peopled, sporadically.
I can always be heard by the mobiles but many times I cannot hear them.
The only recourse is to call the 911 operator if it is a real
life-threatening emergency. We don't pass on drunk driver reports.

Go to Copper Electronic's web page. They have a nice mic wiring guide.

It Just Got EASIER to Promote Affiliate Programs.
You can either join the masses and list your Affiliate Program
in one of the many directories on the net, or you can operate your VERY

OWN directory for FREE. Operating your own directory provides many
benefits, Find out what they are at the "Affiliate Options Directory Of
Associate Programs" http://www.cros.net/dougd/ao

You stay out of Cleveland, Dave, you hear? :-)

DD

--
I just discovered a really easy way to make money while you work or play on your computer. As long as you are connected to the Internet, you will get paid for every hour you use this new program that can be downloaded absolutely FREE. Seems too good to be true? Let me explain it to you.

TeknoSurf.com is one of the oldest and largest Internet marketing firms and they recently created a product that everyone can benefit from. The GetPaid4 Bar is a small bar displaying ads at the bottom or top of your computer screen. Since advertisers want you to view these ads, they pay TeknoSurf to reach you via The GetPaid4 Bar and then TeknoSurf will share its advertising revenues with you.

So all you have to do is download The Getpaid4 Bar and start making money. You can even refer your friends, family and co-workers and you will receive a percentage of their profits in addition to your own earnings!!!

What are you waiting for? GO TO http://www.getpaid4.com/?zaarenoc AND SIGN UP NOW!!

You have a bad ground. Make sure the radio itself has a good ground
even if you have to run a separate wire from its chassis to the frame.
What type of antenna do you have? If it is not magnetic, try to run an
extra ground for it also.

For sale cobra 2000 gtl.

25.645-28045 (no that s not a typo) freq. range, clarifer unlocked, RC channels, converted to cobra 4 pin, variable wattage. works perfect.

No speakers, (has one built in the top case) Case and front rough and ugly, but radio works great. I bough it new seven years ago. and I have been the only one in radio, so if it don't work, blame me :-) Guaranteed not DOA.

Id take $160, + shipping.

Hillbilly.

Totally agree with you.

Makes you want to suggest that people go get themselves their power
supply sorted then go match the amp to the supply!

100A per Kw will get you into the ball-park for average not peak current
drain.

I guess that I'm just not that interested in DXing. I did it back in the late 70's, and it just got old. I'm just not interested in "long distance radio checks". I like to have conversations with people, not 2 second "wham-bam" contacts. It's unfortunate (for me at least) that the CB band is in a frequency range that is frequented by periodic skip conditions.

> it has been done many many times and will continue. for the guys that dont like
dx 2
> meters is a perfect place to be.

I enjoy the conditions on 2 meters and 6 meters. It's just a shame that there isn't more "casual" types of groups on 2 meters. There are many repeater users, that just pass the time during commute times, never really saying much, except what's on their script for the day. The long term simplex users are fewer and far between. Many times, the local 2 meter frequency is dead, so I find myself on CB again, looking for someone interesting to converse with. It's a tough call for me, when 2 meters is dead, and 11 meters is at +10 over S9 skip levels.

Il radio Club COSTA VERDE ITALIA organizza il I� Corso di telegrafia via
Internet, rivolto a tutte quelle persone che lavorano e che di conseguenza
non hanno molto tempo libero, o che vogliono seguire un corso di telegrafia
seduti comodamente nel proprio salotto!
Il corso si svolger� in 29 lezioni di un'ora ciascuna, dove tutti i
partecipanti potranno avvalersi dell'aiuto di un tecnico messo a
disposizione per ulteriori chiarimenti.
Il costo � di L. 15.000, ed a tutti i partecipanti verr� inviato
gratuitamente un programma per l'esercizio della telegrafia.
INFO CORSO : gablecce@tin.it
                                                   Vi aspettiamo numerosi

Hi All,

I have a clean D201 here that has been converted to 40ch PLL. The conversion looks like it was done pretty well, from what I have found out it was done at a shop in Kentucky. Radios works at times but has a few problems, clarifier acts strange, power output and AM RX comes and goes and I have no idea how the VFO is supposed to work now, it only covers about +/- 100KCs depending on what channel its on. I'm selling this for a friend who WAY overpaid for this at a local hamfest. The radio has aftermarket oak end panels which look great. There is a couple holes drilles in the front panel by the speaker that have chrome plugs in them. The D-104 is also included. The owner said he put a new relay in it but that didnt help the AM RX from cutting out. Would make a good parts radio or a nice winter project - the radio looks great and when it does work the TX and RX works great as well.

Anyhow, I havent heard from a person who was supposed to pick it up this weekend so its up for sale again. The owner just wants to get rid of it and doesnt have internet access.

140.00 or close to it, PICK UP ONLY in the Chicago area. Reply by e-mail please.

73,
Kevin

I have two linears for sale.  Both are New-in-the-box, bought new in
1996 and never used.
Both are "high drive" units designed for 15-25 watts SSB drive.
Prices (including shipping):

     Texas Star 350 HD-V:   $175.00 obo
     Boomer Deluxe 250:  110.00 obo
     Both:               250.00

Please e-mail me if you're interested.
Thank You.
Darren Ream

Note:  Theses linears are NOT legal for CB use in the U.S..  Purchasers
are responsible for complying with any applicable local laws.

news:19991205173440.08486.00000605@ng-fh1.aol.com...
> Looking for good 32 pill any suggestions<<<

Before asking that question ask your self a few questions. Some of this may be redundant after reading some of the other post so bare with.

1. Do you have the means to feed this amp enough current, Including driver. Do you have the Alternators,cabling,batteries,regulators,external rectifiers, etc.? There a hefty cost included in order to run a 32 pill right.
2. What is the purpose for this amp?skip talk, shoot out.? A.M.,S.S.B (yes believe it or not, there are guys out there running 16 pills on S.S.B.)
3. What do you exspect to see out of a amp? watts, clean sound?
Which brings us to the next question?
4. do you want class C, OR AB?
5. what's your budget?
6. do you want a box that's is cosmetically clean, heavy duty internal parts, surplus parts, new parts? All this has to do the with price.

YOU USUALLY GET WHAT YOU PAYS FOR. There were allot of boxes mentioned on this list and allot are priced differently. Some of the cheaper boxes are good and work fine but are cheaper because the builders cut corners to bring the cost down. Some of the more expensive boxes are priced like that because they went through the extent of tuning the box so that it is efficient as it can be. This doesn't mean it has any more parts or better parts, it just mean they spent the additional hours tuning it right. (well maybe not hours, I am talking about myself here)

More questions?
1. Is it a printed circuit board with silver coat or a copper clad etch with a router?
2. are the power cable welding cable or nice stereo type cables?
3. are the component beefy? Are the resistors heavy duty? are the caps mica or metal? are they using 2" transformers on the outputs? Good quality relays? Is the heat sink big enough to dissipate the heat properly? Does it include fans? Force air cooled?
4. last and not least, warranty, tech availability? parts and labor warranty?Does the tech live in your area or across the U.S.? Is the tech always busy or bombarded with repairs?

Not to discourage you but you are making a expensive purchase and these are a few things to consider. *Now obviously if your not a tech most of this wont concern you*. If your on the west coast you might want to consider Skull Cracka. He uses very good quality parts like big transformers,relays, powder coated boxes. strain relief fittings, etc. Also his prices are good. This says allot to me when you see craftsmanship in a box, quality parts and the price is low. Now how well he tunes them and they do on the air I cant really say, I have never used one. Oops I lied, I have used a 4-pill and it worked fine for the price and being a class C box. I haven't seen his boxes recently so I cant really say if there still built the same way. I will hightlight three biggest factors I would make in deciding, not to say you should.

1. Price & quality(these go hand in hand)
2. tech location. (This will help for installation and repairs).
3. warranty (parts &labor) This usually does not include pills.

I hope some of this info helps you in your decision.

good luck.
KRS

will if you would get out there and talk a little skip you might in joy it
you can talk to the neighber hood ducks any time
plus you might get to meet some of the people you talk to in dx.

Right on, Boo !!!! I have seen both good and bad boxes come from some builders. The main difference is consistency from model to model and each unit that comes down the line. Out of all of the various units that i have seen, i definitely have favorites. They are NOT of one specific brand either.

As it is, a 32 pill requires a TON of power supply. This means at least 800 amps of ALTERNATOR. Keep in mind that this is just for the 32 pill BY ITSELF !!! If you can't give it this much, forget about ever seeing full output out of it or having it run consistently.

Depending on the efficiency of the specific box that you would want to run, you would also need a very solid driver / pre - driver and radio. Between these things and being able to run the vehicle effectively, you'll probably need about another 150 - 200 amps of alternator. You should figure out how your going to get a real 1000 amps of alternator onto your vehicle. Then think about regulators and batteries.

If you can't afford to set it all up accordingly, you should probably think

about a much smaller box. Be reasonable and deal with reality in terms of what you can really afford and run on a regular basis. This will probably get you much better performance than a big box that is improperly installed.
Sean

-=PEAKABOO=- wrote in message <82fhfp$slo$1@nntp9.atl.mindspring.net>...
I could E-mail you on what I have seen in the past, But their is so much more it than the amp, if you cannot feed the amplifier with the voltage it needs to do the "Rated" output than you would think that every amp you tried sucked. This is where the majority of the Techs or box builders get their bad name and reputations, all because someone did not have the right setup to achieve the possible. I personally have good and bad opinions of the amps out there, but choose not to share them in public as I personally believe that it is shared daily on the newsgroup and why would I want to voice on something that Is meaningless anyway. each person will tell you something different, it all depends on what they run or who they live closest to, most of the guys running battle boxes will say good things about their Techs as to stay on good terms with them so it is in the air when you ask for suggestions. I would be willing to bet that there has been a lot of people who viewed this post of yours and chose not to make a statement as to who makes the best 32 pill, as I have done as well...Silence is golden...

The FCC has spent TONS of money trying to stop the manufacturing of these
amps. Many manufacturers were pulled into court about 2 - 3 years ago and

several received fines. Sean
>

AB7RS wrote in message <384B02A8.9A4@imt.net>...

I don't think the FCC has spent any money looking for people with
illegal amps,linear or not.All bands have power level limits for a
number of reasons.If a few people use many times more than the others on
a band then it makes the band useless for the people operating
legally,although you probably don't care.
  Since CB amps aren't regulated many are very "dirty".

Right on, John. I have also seen some RG-58 use foam and some that used
poly as the insulator. That would make a pretty noticeable difference in
terms of electrical length.

Also keep in mind that most velocity factor ratings are simply that :
RATINGS. I have had very few cables that actually matched the manufacturers
specs. Most are ballpark, but not close enough if doing any type of
precision work. You would really need to do testing to find the individual
cables real VF. Sean
>

John J. Gervasi wrote in message <384B08B8.5A748500@bellatlantic.net>...
The only thing I would add is that VF also matters if you are trying to get
a
true SWR reading. To test the SWR seen from the antenna feed point as
reflected back into the transmitter, a true reading is given if you use a
1/2
wavelength of coax at the test point.   But the 1/2 wavelength is dependent

on the VF, so the length of coax will differ based on the type of coax.

Hi everyone,

I am the author of the original posting "Bruit d'allumage - Ignition noise" in French... I am writing the English translation of this posting, and will post it soon. This is a bit longer, singe I am not English speaker.

Sorry for the French posting... i'm a newcomer on the newsgroups, and not familiar with this environment.

> E mail me; I don't get here often.

There is an excellent article on this subject in the December issue of Popular Communications Magazine (pg. 4). Written by the editor, it describes the slow downfall of REACT, gives suggestions for reviving REACT, and offers suggestions for people who want to help others on the radio without REACT. While I really don't agree with his solutions for reviving REACT, it is a solid article on the present state of emergency communications in the Citizens Band.

As for REACT itself, I think they should get rid of the whole team/club concept and center their efforts around individuals who want to monitor the radio for emergencies. Many people today are not comfortable working with groups of people. It is nearly impossible to get a group to agree on anything, and many of the leaders of these groups are too concerned with self-glory and not concerned enough with emergency communications.

By centering on individuals, REACT could better cover areas of the country where there are not enough people to make up an effective team, and it eliminates the negative aspects of group/club membership (which I think is the main cause for people leaving REACT).

Of course, REACT seems determined not to do this (for whatever reason), so I agree with the Pop Comm Editor - REACT's days as an organization are limited.

Jeffmc3518 wrote:
>
> who gave ANYONE the authority to tell ANYONE
> what to do / not do with their private
> property?

Jeff, a person is absolutely free to do absolutely anything with his private property (radio) as long as it does not affect anyone outside of his private property. The person can use the radio as a paper weight, play football with it in the backyard, or use it for a hood ornament on his car.

But, as soon as that person starts transmitting, that person is no longer confining his activities to his private property - radio waves do not stop at his property line. At that point, society, through its elected government, has a right to have some say how that person uses the radio frequencies that belong to the society as a whole.

Our society, called the United States of America, elected a Congress to pass laws for the common good (not an individual's good alone - the common good). And that Congress created the Federal Communications Commission to make the rules affecting radio.

Now, if somebody does not like the way Congress works, he is free to change Congress. If a person does not like the FCC's control of radio, he is free to talk to his member of Congress. If a person does not like the rules that the FCC has created, that person can talk to the FCC. All of that is a person's right as a member of this society.

However, I can tell you right now that there is no way the FCC is going to expand the frequencies for CB, or increase the power allowed for CB, or increase the range that CB'ers are legally allowed to make contacts, or anything else. Why? BECAUSE IT DOES NOT SERVE THE COMMON GOOD.

Yes, all of these might benefit some CB'ers. But, for every CB'er shouting for increased power, there is another person complaining about interference from CB radios using increased power. For every CB'er demanding increased frequencies, there is another person complaining about the incroachment of CB'ers into their assigned frequencies. And for every CB'er shouting for increased range, there is another Cb'er complaining about the interference by people breaking the existing rules.

When Amateur Radio is added as an existing option that can meet all of the demands for increased range, power, and frequencies, there is absolutely no reason for the FCC to even consider a change in the existing rules. Now some may not like Amateur Radio as an option, but it is an option that serves the common good (even if it does not serve the good of the few individuals who don't like it). Therefore, it is the only option that a CB'er, unhappy with the existing Citizens Band, is likely to get under the current climate towards CB'ers.

> i don't hear anyone screaming about
> broadcast tv putting out more and more
> graphic sex, language and violence.

And, since you brought it up, if you don't like what is on television, complain to the FCC. That is your right as a member of this society. But bad behavior by a others in this society does not give anybody else the right to behave badly, nor does it minimize anyone else's bad behavior (in other words, bad behavior on television does not justify bad behavior on the radio).

to 30
> MHz--which are, by necessity, a compromise.

No, he doesn't work for Motorola, and no, you don't have to lose anything to get general coverage.

Sorry if all your experiments where with a Sangean receiver. Those who are interested in general coverage, and spent more than a quarter of the welfare check have found that a real receiver costs nearly a thousand dollars, and performs quite nicely.

I will put the old Collins R-390 against anything that you have today.

>

> You mentioned Uniden. I was thinking specifically about the RCI-2950/2970,
etc.
> I've run them side-by-side with general coverage big-name radios costing
> nearly ten times as much. There's no getting around it. The RCI receivers
are
> H-O-T!

Yes, they are...

H-O-T enough to pick up a lot of shit other than the signal that you are
trying to get!

I see better rejection, sensitivity and tonal quality out of my Kenwood 440
than I do out of ANY 11 meter rig I have... And I do have a couple... Both
tube and solid state.

The Kenwood kills the Galaxy (RCI) hands down.

I suggest that you get a non-butchered ham rig and do the comparison.

>

Jeff,
This is not a performance radio. So to compare it is not a fair thing to do. You are comparing apples to oranges. This is a radio for the not to interested in CB user. It works fine, but is limited in the receive,as it can be very choppy if you back the squelch down.

It is great for small spaces and will provide you with the road information needed on a travel expedition. But it is not a skip shooting, go getem, hopped up cb radio that a lot here are looking for.

But if you are looking for a radio for road trips only get a good antenna, have it tuned to your vehicle and get the 75wxst. Its cute, its functionable and it will suit your needs in this case.

A uniden Pro510xl is a good small radio for performance. These opininons are mine and not neccessarily shared by those who post on this new group. No offense intended.
God Bless and happy Holidays.

the current cycle should peak in about a year. the dx will be just as strong on the down side of the slope as it is now on the up side. :)

Good luck and best regards from Tim 082.

PB,
I'll have to agree with you on that one too! Being Part of the Construction City (Paterson.....C-City) bunch for some time and knowing where that shop is also, I'm beginning to think I'll be opening up a shop next year when I move back to Jersey . Been hearing nightmarish stories from Highdrive (AKA 13, Mean Old Man in The Antique Van) about the shops in Jersey and might be talked into it!

If you want to see some good redneck humor, check out this site called Dr. Verne's Northern White Trash Etiquette. It's got a column this week on a woman who needs cooking tips on how to catch herself a white trash man. Pretty funny. There's also this thing about Bubba Claus, Santa's cousin, taking over the Christmas toy delivery.

It's at http://homestead.com/drverne

The key phrase is "built properly". How many so called "cb amps" do you think are "built properly"? Dave made? Don't even try. Even the relatively clean and stable Texas Star, can't hold a candle to the amateur grade solid state mobile amps, as far as filtering, proper biasing, and overall clean operation. Of course you'll pay at least $600 for a mobile 1 KW peak amp. But as they say, you get what you pay for.

Or better yet, make sure that the SWR of the antenna is 1.1:1 then the standing waves reflected back into the coax become insignificant, and the length of the coax becomes unimportant. Only when there are standing waves does the length of the coax matter.

Dennis Lassetter wrote:

> I would be pleased if I never heard any more skip on the radio. I hate it. It serves no purpose, it proves nothing. I much prefer to talk local, say within a 50 mile radius. All the skip we hear in my area is foreign language and just messes up everything as far as local talk goes.I have been hearing skip for 39 years on my CB radios and have never gotten use to it. I guess it will never end. Bah humbug.

I agree. Skip does nothing but reduce the enjoyment of the locals trying to socialize over the air. Once you've worked a few skip stations, it becomes boring. Been there, done that.

Unfortunately, all that you can do is to pray for a swift end to this sunspot cycle. Then the band will return to a state of blissful quiet, with the locals once again able to talk without needing 100 watts or more of power, or having to run the squelch up at S9 levels.

Sean,

What are you talking about? Nothing you are saying is incorrect - it's all understood and agreed it's correct. In fact, check back a few weeks ago - I think you will find I said the same thing.

However, you didn't read very closely - the fellow here says
">That is to say; while the vehicle is
> moving or it is moved close to large metal objects, the antenna
> impedance seen at the transmitter end of the coax changes."

This statement is totally correct...this statement is not:

">Certain lengths of coax will keep these changes to a minimum assuming
> that the antennas on the roof are 50 ohm"

No coax length is going to prevent the *antennas* feedpoint impedance from changing when a metallic object comes in close proximity with

an antenna - period. The "mutual impedance" (the antennas self impedance
and the effect of surrounding elements) cannot be controlled by
coax length.

The ghost of Bob.

I think you have been buying the wrong brand cable.

| Also keep in mind that most velocity factor ratings are simply that :
| RATINGS. I have had very few cables that actually matched the
manufacturers
| specs. Most are ballpark, but not close enough if doing any type of
| precision work.

What's the difference of that and collecting information to post on a news
group?
Some people find things more amusing then others.

I dont know his opinions, but:

L = Inductance
C= Capatanace
E= Voltage measured in v(olts)
I= Current measured in a(mperage)
P= Power measured in w(attage)
R= Resistance measured in ohms

Just a few, but its something for now....

Try looking for the BLACKSTONE or MUSCLEMAN boxes. Hard to come by but really is one to be had.

Otherwise, DAVEMADE, X-FORCE, SKULLCRAKA, and PIRATE are some of the brands to look into. I've heard good and bad reviews of the FOXIE, AT&T, GOOSERIDER and SUNNY boxes but these might be warranted as a look-see for your DXing needs. Properly tuned, and matched throughout your system and you'll never go wrong. My 2 pennies and a bag-o-chips...

137... schuckin' and duckin' around the Valley of Death, back out!

I personaly do not get excited at the fact that I am "bucking the FCC" I do not feel like I am doing something meaningful when I break the rules, I personally wish the guys who freeband would either freeband in a QRP fassion and stay closer to channel 40, or do it below channel one, I know I will get flamed for this, but the majority of the hams could give a rats ass about what a cber does or how much power a cber runs, but when you start interfering with their QSO they tend to get a little aggrevated, The 10 meter band is wide open right now and the closer you get to the freq that those guys are operating on, the more prone you are to bleed on them. blah blah you get the point. Any way that is what I think about it whether it matters or not, I think more people should have a concious about what they are doing, Tim I know what you think and this in no way was dirrected at anybody in perticular.

I could E-mail you on what I have seen in the past, But their is so much more it than the amp, if you cannot feed the amplifier with the voltage it needs to do the "Rated" output than you would think that every amp you tried sucked. This is where the majority of the Techs or box builders get their bad name and reputations, all because someone did not have the right setup to achieve the possible. I personally have good and bad opinions of the amps out there, but choose not to share them in public as I personally believe that it is shared daily on the newsgroup and why would I want to voice on something that Is meaningless anyway. each person will tell you something different, it all depends on what they run or who they live closest to, most of the guys running battle boxes will say good things about their Techs as to stay on good terms with them so it is in the air when you ask for suggestions. I would be willing to bet that there has been a lot of people who viewed this post of yours and chose not to make a statement as to who makes the best 32 pill, as I have done as well...Silence is golden...

    Your radio tech might be able to add a tuned network before and
after the rcv amp. This will cut down or eliminate the other junk
coming in from outside the cb band.
    He may even find that your rcv preamp is oscillating and this
would/could cause other signals to be mixed with your incoming rcv.
Hard to tell from here how to fix it but your problem is not
isolated at all. Others have complained about the same thing before.

Since I can't see how you wired it I can only give limited info.

You will need a single pole double throw relay.

What you'll need to do is wire the roger beep to key the external relay and not the rig itself.

Remove the keying and rcv wires from the mic socket and attach them to the relay so when the relay is relaxed(unkeyed) the one for rcv is grounded and when the relay is energized the tx line will go to ground. Depending on the brd you might have to reverse this as I can't remember if the roger beep holds the relay keyed on rcv and lets it go on tx.

Next you'll add a wire from the tx pin of the mic socket to the roger beep brd where it says PTT or tx input. What this does is allow your mic to key the roger beep brd which then keys the relay and when you let go of the mic the rgr beep brd continues to hold the tx on for the length of time it needs to run through the tones.

The audio output of the rgr beep needs to go to the top of the mic gain control. This is the side of the control that goes directly to the radio mic circuit. You'll probably need to add a resistor between the rgr beep and this control to bring the beep level down to a comfortable level. You may have a audio output control on the rgr beep brd so the resistor may not be needed.

Good luck, BobC.

  There were similar radios to the Titan such as the Cherokee ah-100 but they
were stuck in "10kC CB-type" channel steps. The Titan tunes in 1kc increments
(ie...28.305-306-307 ect). The Eagle you mention may possible be a 10kC version
unless stated otherwise in their descriptions. For picture/specs of the
Titans:

Just Wondering,What's everyone set-up out there???i usually alternate gear,so im not on any one radio,mic,etc for more than a few days at a time,but here is what ive been running lately:

RADIO-A Uniden Grant LT...with channels,open clarifier,tune-up.
MIC-A Shure 526t desktop ..works very well with the grant,,its a good talker
ANTENNA-An Antron99 on the chimney about 60ft
ACCESORIES-behind the radio im running a Drake tv-3300 low pass filter...a radio shack digital wattmeter (you might remember them from a few years ago)..internally the grant doesnt have anything installed,but i was thinking about taking my r.b board out of my 148 and throwing it in the grant...anyway thats what i got...73's

The only thing I would add is that VF also matters if you are trying to get a true SWR reading. To test the SWR seen from the antenna feed point as reflected back into the transmitter, a true reading is given if you use a 1/2 wavelength of coax at the test point.   But the 1/2 wavelength is dependent on the VF, so the length of coax will differ based on the type of coax.

I think you are all missing the point. Personally I would rather see a tougher technical exam and maintain the reserve of current bands that are now designated as CW only. But make the ability to use CW optional for the exams. Look, if you can't communicate using code -- I have tried to learn it many times and have failed to discern 4 tone characters -- then use one of the other modes available but don't deny me the right to certain frequencies for phone because I can't use CW on other frequencies! If this approach is used, you will get better qualified operators due to the tougher technical exam and still have those who want to use code able to do so. What's more, you will increase the number of operators thus breathing new life into Amateur Radio.

Just a thought,

John

Definitely agreed, been there done that. I never paid for a Rat Shack
radio but I have had a few through trades and even the TRC465 that I got
NIB turned out to be a piece of junk. I would never accept one even as
part of a trade of many items, they are worthless to me.

I doubt that you will find many military rigs with AM coverage on HF. They
shifted to SSB decades ago.

The King of military AM rigs was the ART-13. It covered a frequency span from
below the broadcast band (with an adapter) to 18 MHz. It was plate modulated
and put out a rock-crushing signal from the 813 final, with 811-a modulators!
I believe they were last built in the late 40s or early 50s, although
re-manufactured units were available as late as 1970 in the surplus markets.

One source you might try is Fair Radio Sales in Lima, Ohio. If there is an AM
military rig, they probably have it.

****

It still does not correct the problem.

You do not correct SWR probelms by adjusting coax length. All you do is trick the transmitter into seeing the impedance it wants. If that is what you wish to do then that, it is okay by me. Besides any antenna can have a matching network that will transform it's impedance to that of the transmission line. It is not done by conjugate matching either. Conjugate match works great for amplifiers. When the complex conjugate is presented to the transmitter it is not a matched condition. Matched conditions on transmission lines are only when the load and the source are the same as the characteristic impedance of the transmission line.

I read your web page on coax and came to the conclusion that you have so over simplified transmission lines or you flat do not know what you are talking about. I was in a mode to correct the errors in it that I flat stopped. It will be better to rewrite it than correct it.

For a licnesed amatuer, I would have expected you would have used at least the ARRL Antenna Handbook as a reference. It is simple in many ways but better than what you have on your web page.

>Personally I would rather see a tougher
>technical exam and maintain the reserve of current bands that are now
designated as CW only. But make the ability to use CW optional for the exams. Look, if you can't communicate using code -- I have tried to learn it many times and have failed to discern 4 tone characters -- then use one of the other modes available but don't deny me the right to certain frequencies for phone because I can't use CW on other frequencies! If this approach is used, you will get better qualified operators due to the tougher technical exam and still have those who want to use code able to do so. What's more, you will increase the number of operators thus breathing new life into Amateur Radio. Just a thought,
>
>John

John, I have to totally agree with you here. I am a newly licensed Ham after about 17 years of toying with the idea. I have been a CBer since about 1973/1974. I do have the technical knowledge and the ability to learn more. I have absolutely no desire to use CW, but have no problem with those who do. Your ability to pound a key or not is not a sign of how good a Ham you can be. Proper education in the Hobby and a warm welcome are what is needed. I am currently a Tech, but I plan on doing my 5wpm to upgrade to the HF frequencies because I HAVE to.

It would seem that for those Hams who are worried about the CBers coming over and ruining it for them need to open their eyes. I went to a hamfest last month and it is half the size it was only two years ago. There was also a Computer show at the same Fairgrounds that was packed all day with a constant line to get tickets.

Computers are doing more to take away from Ham Radio than CBers are doing to "ruin" Ham Radio. Maybe if CBers were met with more enthusiasim, they would feel a desire to join and/or upgrade and improve their knowledge. With computers at the forefront of so many things, including communicating around the world, maybe CBers can be a saving grace for Ham Radio. Just like the bad Hams are not the norm, not all CBers are bad either.

Just my .02 worth.

that is a poorly desinged preamp. a lot of them on cb amps bring in shortwave
signals. i had one before that did that and i would just tune around and enjoy.

Good luck and best regards from Tim 082.

Hello all,

I am interested in finding out about rigs that have all of the controls and the display in the mic (I have a space-limited application).

It looks like the best option might be the Cobra 75 WX ST, but I'm certainly open for suggestions.

I have a couple of specific questions:

Are the finals and the receiver rf circuits actually in the remote box, or is the box just a sort of a junction box that passes the signals to the handset?

Also, am I sacrificing much in performance if I go this route? Cobra has always had a great reputation, but is this type of radio too much of a compromise, even for them?

Thanks in advance.

-Jeff

>
don't feel bad. they never answered my question either.
so as to not start a fight this time, i'll ask mine in a generic sense:
who gave ANYONE the authority to tell ANYONE what to do / not do with their
private property?
there may be those who say that we spoil cb with higher power, extra channels,
noise toys or whatever but i don't hear anyone screaming about broadcast tv
putting out more and more graphic sex, language and violence. the FCC doesn't
seem to have a handle on them either. it would seem to me that all of this
effort would be better spent trying to clean up this segment of the radio
spectrum that reaches a larger portion of the population and a greater portion
of that population who is at greater at risk for damage, (our youth).
it seems funny that their are more things that can be said and shown on free
broadcast tv than you are allowed to say or show on cb, ham or sstv.
the owners of broadcast tv don't even have to apply for a license in their own
name and the engineer doesn't even carry any risk for broadcasting any of it.
if we break a few rules, there is a generic segment of the radio community that
crawls up our collective asses for it. how does broadcast tv get away with it?
go figure???
                                              jeff
                                   (A.K.A. PLLO2A)

Anybody know of some good repair shops
around Buffalo.
I have an older Midland weathermax to be peaked and tuned and a newer

Uniden that needs some work done on it too.
thanks,
Chris

Not a 50 ohm coax.

> And people flame the h*ll out of others for "trimming" coax.

There is no reason to trim coax.

This was sent to me from a CB Pal.... Enjoy and keep up the good spirit!!!!

T'was the night before Christmas, when all through the land, no skip was rolling, not even ducks stirring on side band. The D-104's were polished and hung with great care. In hopes that "skip'' would soon be there. Ducks were nestled all snug in there shacks, while some were still hiding under their rigs. All with visions of becoming a superstars dancing through their heads............. When all of a sudden, out in DX Land, there was much clatter. I sprang from my recliner to see what was the matterI ran . I ran over to my Grant, turned up the volume and turned the rotator too. There was "skip" rising and I found it to be surprising. So, I sat down and decided to listen a spell. And, I could tell that some of the heavy weights had been sprung from jail.

From the Magnolia, Bayou, Big Horn, Sandpile, Buckeye, Land of Lincoln, Blue Grass, the East Coast, West Coast, the Mighty Blue and the Mini Grass, too.
The Super Star voices rang out with a roar.   Good Friend, Mean Pill, Carpet Bagger, 766, Captain Boss, Golden Arms, Wild Greek, The Last Word, Prime Minister, Number 13, and many many more. Some of the biggest and best "P Pickers" that have ever spiked a D-104.

Sam in the Dome, Ten Speed, Earplugger, IceCold, Carpet Man, Black Diamond and Ghetto Shorty, too.
What a wonderful sound that was made. All the "big boy" with the "hammer down" making such a joyous noise and having fun playing with their toys. Then, all at once the "skip" was done, it had been fun and everyone had won. Yes, it was the Night Before Christmas on 27.025 MHz and the "mud ducks" got some, too.

End

Happy Holidays to each of you and your families. I hope this will be a memorable holiday season. To each, I do wish the best and continued good health and wealth in the year 2000. May God continue to shed his grace on each of our places.

Yours Truly,
Twenty Eight Trey, A.K.A. TipToe
Downtown Three River Town
Pittsburgh, Pa

Its funny that you bring this up. I have some locals here running some of the nicest sounding rigs, Eagles,Yeasu,Trams. All running with a minimum of a KW to talk across the street. Ive got a neibor that runs a home brew Raytheon with pair of 3-500z local!!! All they do is bitch, moan and cry about each other all night long. It doesn't bother me none because they don't come out till the skip is gone, they hate skip. I guess they cant figure me out just like I cant figure them out, different worlds I guess.

KRS
